

NATIONAL POPULATION AND HOUSING CENSUS 2024

MAIN REPORT

OCTOBER 2024

National Population and Housing Census 2024

Main Report

This report presents the main findings from the National Population and Housing Census 2024 undertaken by the Uganda Bureau of Statistics (UBOS).

Additional information about the Census may be obtained from the Uganda Bureau of Statistics (UBOS), Plot 9 Colville Street, P.O. box 7186 Kampala, Uganda; Telephone: (256-414) 7060000 Fax: (256-414) 237553/230370; E-mail: ubos@ubos.org; Website: www.ubos.org.

FOREWORD

ganda conducted her 6th post-independence National Population and Housing Census in May 2024. This Census was technologically driven where 135,230 field staff were involved in data collection using electronic devices referred to as Tablets.

The National Population and Housing Census 2024 preliminary findings were disseminated on 27th June 2024, providing statistics on population size, distribution and composition up to District/City level. In this report, we provide the main findings on the demographic, socio-economic and environmental characteristics of the population, as well as information about the households and communities where they reside. Detailed statistics and information up to the lowest administrative unit have been compiled and are to be uploaded on UBOS website.

The National Population and Housing Census 2024 findings are timely in relation to the current planning cycle. In particular, the data and information will provide baseline information for the fourth National Development Plan (NDP IV), consequent planning up to the lowest administrative level and monitoring projects and programmes, to mention a few.

The Bureau is grateful to the Government of Uganda that funded 98 percent of the Census 2024 and Development Partners, namely the United Nations Population Fund, the United Nations High Commission for Refugees, the United Nations Children Fund, World Food Programme, United Nations Development Programme, who contributed the remaining 2 percent. Gratitude is also extended to the United Nations Economic Commission for Africa (UNECA)-Africa Centre for Statistics for their technical support provided in preparations and implementation of the Census.

We extend our sincere gratitude to the Census Committees, in particular, the National Census Council headed by the Rt. Hon Prime Minister, the National Census Steering Committee headed by the Permanent Secretary / Secretary to the Treasury, the Board Committee, key stakeholders in the national and international statistical systems, the general public, UBOS and census enumeration staff who contributed to the success of the census. We would like to congratulate all those who tirelessly worked towards the successful digital census.

The Bureau appreciates the Electoral Commission, Uganda Peoples' Defence Forces, Uganda Prisons Services, Internal Security Organisation and Local Governments for their logistical support.

Finally, we urge the public to utilize the census data and statistical information for planning, policy design, programme/project implementation, decision making and public debates.

It matters to be counted

Chris Ndatira Mukiza (PhD)

EXECUTIVE DIRECTOR/ CENSUS COMMISSIONER

Indicator	Male	Female	National
Sustainable Development Goal Indicators			
1. No Poverty			
1.3.1 Proportion of population covered by social protection floors/systems.			
a) older persons benefiting from SAGE	17	17.9	17.6
1.4.2: Proportion of total adult population with secure tenure rights to land with legally recognized documentation	38.2	24.4	30.7
2. Zero hunger			
2.1.2 Prevalence of moderate or severe food insecurity in the population, based on the Food Insecurity Experience Scale	n/a	n/a	46
3. Good health and well-being			
3.1.1 Maternal mortality ratio ¹	n/a	207	207
3.2.1 Under-five mortality rate ²	50	41	46
3.7.2 Adolescent birth rates per 1,000 women			
a) Girls aged 10-14 years³	n/a	0.4	0.4
b) Women aged 15-19 years⁴	n/a	61.2	61.2
3.8.2 Number of people covered by health insurance or a public health system per 1,000 population ⁵	1.1	1.0	1.1
5. Gender equality			
5.b.1 Proportion of individuals who own a mobile telephone	46.4	40.7	43.3
6. Clean water and sanitation			
6.1.1 Proportion of the population using safely managed drinking water services ⁶	80.3	82.6	81.1
6.2.1 Proportion of population using safely managed sanitation services, including a handwashing facility with soap and water ⁷			
6.2.1a - Proportion of population using safely managed sanitation services	42.4	46.1	43.1
6.2.1b - Proportion of population with handwashing facilities with soap and water available at home	24.2	24.5	24.3
7. Affordable clean energy			
7.1.1 Proportion of population with access to electricity ⁸	n/a	n/a	25.3
7.1.2 Proportion of population with primary reliance on clean fuels and technology ⁹	3.8	4.2	3.9
8. Decent work and economic growth			
8.5.2 Unemployment rate			
a) 14-64 years	10.7	14.5	12.6
b) 15 years and above	10.5	14.2	12.3
8.6.1 Proportion of youth (aged 18–30 years) not in education, employment or training			
a) 18-30 years	42.7	57.5	50.9
a) 15-24 years	37.1	47.3	42.6
210. Reduced inequalities			
10.7.4 The proportion of the population who are refugees	0.8	0.9	0.9
11.6.1c: Proportion of population with access to basic municipal solid waste collection services ^b	7.7	9.6	8.4
16. Peace, justice, and strong institutions			
16.9.1 Proportion of children under 5 years of age whose births have been registered with a civil authority°	n/a	n/a	36.3
17. Partnerships for the goals			
17.8.1 Proportion of individuals me using the Internet	10.6	7.6	8.9

Indicator	Male	Female	National
National Standard Indicators (NSI)			
Literacy Rate (10 Yrs.+)	77	72	73
Total Population (millions)	22.5	23.4	45.9
Population growth rate			2.9
Total fertility rate		4.5	4.5
Labour Force Participation rate (LFPR)	48	39	43
Employment-Population Ratio	43	33	38
Proportion of the population that is food secure			54
Prevalence of Child Marriage			7.4
Crude Death rate			4.6
Internet penetration rate (internet users per 100 people)			9.2
Percentage of children of pre-school age attending pre school	49.4	51.8	50.6
Vocational school enrolment rate (% of total enrolled in tertiary)	0.9	1.1	1.0

na = Not applicable

- Expressed in terms of maternal deaths per 100,000 live births in the 7-year period preceding the survey
- ² Expressed in terms of deaths per 1,000 live births for the 5-year period preceding the survey
- ³ Equivalent to the age-specific fertility rate for girls age 10-14, expressed in terms of births per 1,000 girls age 10-14
- ⁴ Equivalent to the age-specific fertility rate for women age 15-19, expressed in terms of births per 1,000 women age 15-19
- ⁵ Population is women and men
- ⁶ Measured as the percentage of households using an improved water source: the percentage of de jure population whose main source of drinking water is a household connection (piped), public tap or standpipe, tubewell or borehole, protected dug well, protected spring, or rainwater collection. Households using bottled water for drinking are classified as using an improved or unimproved source according to their water source for cooking and handwashing.
- Measured as the percentage of households using an improved sanitation facility: the percentage of de jure population whose household has a flush or pour flush toilet to a piped water system, septic tank or pit latrine; ventilated improved pit latrine; pit latrine with a slab; or composting toilet and does not share this facility with other households.
- ⁸Measured as percentage of population using national Grid and solar for lighting
- ⁹ Measured as the percentage of the households using clean fuel for cooking.
- ^a includes older persons, persons with disabilities only
- b considered only households waste vendor & local dump supervised by urban authority
- °Considered age from 0-4 years

INTRODUCTION

opulation and Housing Censuses are the Government's largest, most expensive, complex, and logistically-demanding statistical undertakings in most of the countries in the world, including Uganda. A population census is the complete enumeration of all persons in a country at a specified time. It involves the collection, compilation and dissemination of demographic, social and economic characteristics relating to the entire population. It also involves collection, compilation, and dissemination of statistical data on living quarters and occupants therein. In Uganda, Population Censuses remain the main source of demographic and socio-economic data.

The National Population and Housing Census (NPHC) 2024 is the eleventh in the series of Censuses Uganda has conducted, six (6) of which were conducted in the post-independence period. Population counts were conducted in 1911, 1921 and 1931, while scientific Censuses were conducted in 1948 and 1959. The African and non-African populations were enumerated separately in each of these Censuses. During the post-independence period, Population Censuses were conducted in 1969, 1980, 1991, 2002, 2014 and 2024. These were national in nature with both African and non-African populations being enumerated simultaneously. Over time, Census undertaking has improved in quality and scope, with every Census being more comprehensive than the preceding one. The NPHC 2024 is the first digital census conducted in Uganda. This was conducted during the period 10th - 19th May 2024. The period for data collection was extended to 26th May 2024, to cover Metropolitan Kampala.

The Census was designed and implemented to provide reliable and accurate data for evidence-based decision making, to support the implementation and tracking of progress and achievement of National and International Development Frameworks like the Africa Agenda 2063 (AA2063), 2030 Agenda for Sustainable Development (SDG's) and the National Development Plans (NDP).

1.1 LEGAL FRAMEWORK

The Uganda Bureau of Statistics (UBOS) Act, 1998 CAP 310 Section 13 provides legal authority for conducting a census which stipulates that, "the responsible Minister may, on the recommendation of the Board, direct, by statutory order, that a census be taken, where applicable, on any matter specified in the Fourth Schedule to this Act". One of the main fundamental principles of official statistics is ensuring confidentiality of the data collected as stipulated in Section 19 of the Act. In addition, all the field officers swore the Oath of Secrecy which was administered by or on behalf of Chief Magistrates. This formed the legal basis for undertaking the NPHC 2024 and adherence to data privacy and protection protocols.

1.2 OBJECTIVE

The overall objective of the NPHC 2024 was to generate bench-mark statistical data to inform the NDP III, SDGs and other Regional, Continental and Global Development Frameworks.

The specific objectives were to;

- i. Measure the present size of the population of Uganda, its spatial distribution among regions, districts, wards and among rural and urban areas;
- ii. Determine the present demographic, social, economic, environmental and cultural characteristics of the population of Uganda;
- iii. Determine the rates of fertility, mortality and migration among the population to come up with the natural and overall growth rates of the population of Uganda; and
- iv. Constitute an updated sampling frame for Uganda and produce maps for each Enumeration Area (EA) for future surveys

10

1.3 ORGANISATION OF THE CENSUS

1.3.1 Institutional Arrangement

The Governance structure for the NPHC 2024 is comprised of the National Census Council, as the apex body, headed by the Rt Honorable Prime Minister. This was followed by the National Steering Committee, headed by the Permanent Secretary and Secretary to the Treasury, then the UBOS Board of Directors headed by the Board Chairperson, UBOS Management, headed by the Executive Director/Census Commissioner, the Census Technical Advisory Committee headed by the Deputy Executive Director /Deputy Census Commissioner, and the Census Management Team, headed by the Director, Methodology and Statistical Coordination Services. The structure also comprised other subcommittees including the Legal, Audit, and Technical Committees, Project Implementation Team, Secretariat, Publicity, Information Technology (IT), Quality Assurance, Monitoring, and Evaluation, among others. Census teams and work streams were created to undertake the census implementation.

The NPHC 2024 activities were carried out in the Districts, Cities and Special areas. At the Higher Local Government level, each District or City created a District/City Census Management Team to oversee the NPHC 2024 planning and enumeration activities. Special areas mainly included the self-enumerating entities comprising Uganda Prisons Service (UPS), Uganda Police Force (UPF), Uganda People's Defense Forces (UPDF), Diplomatic Missions, Uganda Wildlife Authority (UWA) camps, Refugee Settlement camps, and the Islands. The NPHC 2024 activities used both the Local Government (LG) and Institutional structure, respectively for the districts, cities and special areas, respectively.

District/City/Special Area Census committees were constituted for all 146 districts, 11 cities, and the Special Areas. These committees were headed by the Chief Administrative Officer (CAO)/ City Town Clerk (CTC) /Special area Accounting Officers and comprised District/City/Special Area Census Officer (D/CCO), Assistant District/City/Special Area Census Officer (AD/CCO), District/City/Special Area Information Technology Officer (D/CITO), and District/City/Special Area Publicity Officer (D/CPO).

Depending on the size of each LG, District/City/Special Area, District/City Representatives of the Census Commissioner (D/CCR) comprising staff from UBOS, National Population Council and Academia (Makerere University and Kyambogo University) were assigned the role of overseeing the entire NPHC 2024 activities at the District/City level.

1.4 CENSUS IMPLEMENTATION

A. The Pre-Enumeration Phase

Census Mapping

Census mapping is the process of delineating the country into enumeration areas to facilitate smooth enumeration of the population. A well implemented mapping is considered pivotal for the success of the Census. Census Mapping was undertaken between May 2021 and April 2024. This was aimed at obtaining digitized Enumeration Areas (EAs), updated geography lists and an infrastructure database. The specific objectives of the Census mapping were:

- i. To produce digitized area maps for use during the enumeration exercise.
- ii. To generate information for use in planning for the NPHC 2024 enumeration such as estimation of quantity and distribution of human resource and enumeration materials at all planning levels.

Development of Tools

The process of designing appropriate documents to solicit the required information from respondents is an effective stage in preparation for data collection.

The development of the Census questionnaire was highly consultative to accommodate the views of internal and external stakeholders. Consultative meetings were organized to collect views on the data requirements from various categories of data users, including Central Government, LGs, Civil Society, Development Partners, Academia and the Media. Arising from the consultations, five (5) questionnaires and their respective manuals were developed, namely, Household Questionnaire, Institutions Questionnaire, Floating Questionnaire, Accommodation (Hotel) Questionnaire, and Community Questionnaire

The questionnaires were designed to collect information on a wide range of personal, household and community characteristics. The household questionnaire was translated into 20 local languages.

Pretest

Four pretests were undertaken in Greater Kampala to assess the suitability, adequacy, completeness of questions, the language and understanding of the questions by the respondent. The pretests were carried out in selected enumeration areas in Wakiso and special area of Kampala. The objective of the third and fourth pre-test was to examine the sequencing of questions, testing of new questions which were introduced in the NPHC 2024 such as health outbreaks and postal code questions. A training was carried out in June 2023 to prepare the team for a pilot exercise.

Pilot Census

The 2023 Pilot Census was conducted in two phases. Phase one was conducted in June 2023, and phase two in August 2023. Phase one covered 12 districts, namely Bunyangabu, Buliisa, Kole, Kotido, Koboko, Omoro, Tororo, Serere, Namayingo, Nakasongola, Kisoro, Buhweju and one city namely Mbale. Phase two covered Greater Kampala comprising Kampala Capital City, Mukono and Wakiso districts. The exercise was conducted to test the Census processes and procedures to achieve adequate preparedness for the NPHC 2024.

The 2023 Pilot Census successfully tested the Census processes and procedures in the different regions across the country. The exercise revealed that UBOS was adequately prepared for the NPHC 2024, if the challenges identified would be sufficiently addressed in line with the proposed recommendations.

ICT Infrastructure and data management

The Bureau procured 121,240 handheld electronic devices (tablets) with MTN and Airtel APN cards. Other Information and Communications Technology (ICT) equipment procured for data processing and analysis included 46 desktop computers and 12 laptops. An ICT environment was established to manage the data collection and retrieval of individual records of over 47 million persons (projected population) and over 70,000 community records during the census enumeration exercise.

The data capture application was configured using CSPro software. The application was programmed with clear skip patterns, inbuilt consistency and integrity checks to reduce reporting errors, and thus enhance quality data.

During enumeration, upon completion of an interview, the enumerators would immediately send data directly (synchronize) to the server, from the tablets. The data was downloaded daily for all questionnaires. A Network Operations Centre (NOC), referred to as a situation room, was set up for real-time monitoring of the progress on data collection, and to monitor the daily spatial coverage. This played a significant role in ensuring data quality and coverage.

A multilayer firewall was installed to provide the required ICT Cyber security for protection of data during transmission to, and storage on the server. Access to the server and data was restricted with defined usage categories. The data collected is encrypted when stored on the server to ensure confidentiality of individual information.

Recruitment, Training and Capacity Building

The CAO/CTC/Special area Supervisors had the overall responsibility for the Census exercise in their areas of jurisdiction. They nominated the respective D/CCOs, AD/CCOs, D/CITOs, D/CPO and Subcounty/Division Supervisors. The Enumerator Supervisors and Enumerators were directly recruited by their respective CAO/CTC/Special Area supervisors, using the UBOS e-recruitment system.

The training was conducted in 4 tiers, cascaded as follows:

- Tier I involved training of selected UBOS staff in a Training of Trainers on Census concepts and Training Skills.
- Tier II comprised District/City/Special area level Supervisors in a 9-day residential workshop. The Trainees were split into ten classes by sub region, and these were run concurrently.
- Tier III involved training of the Sub County/Division level Supervisors by the District/City level Supervisors in a nine-day training; the training was conducted at District headquarters.
- Tier IV, the final stage involved training of Enumeration Supervisors and Enumerators in a nineday non-residential training at the respective Sub County headquarters.

To ensure quality, the number of trainees per class did not exceed 70 people. Where the number of participants was exceeding the threshold, arrangements were made to split the classes and recruit extra trainers beforehand. The following were provided during the training.

- Soft copy training materials. These included power points presentations on all topics, e-manuals e-questionnaires, training videos and an e-photo gallery in the manual, on key concepts such as housing characteristics, water sources, types of functional difficulties, agricultural crops economic activities, among others. The questionnaires were also hyperlinked to the e-manual.
- Training platform for tier two level for handling the question-and-answer session online. This was accessed by all participants at the same time, given that there were ten classes running concurrently. For tiers III and IV, WhatsApp groups were formed as discussion platforms.
- The monitoring and evaluation/quality assurance during training was electronically managed with a daily assessment tool for all trainers and a set of assessment questions using the mentimeter software package.

All NPHC 2024 field staff underwent mandatory training on Census concepts and procedures to ensure transfer and mastery of the skills and knowledge for conducting the digital census. Overall, the exercise has enhanced staff capacity in undertaking large scale digital censuses and surveys within the National Statistical System (NSS).

Advocacy and Publicity

Any census campaign plays a very vital role in ensuring that the public is prepared for the census to ensure maximum cooperation and reduce non-response during enumeration. A wide range of campaign activities were undertaken so that the census message could reach every person and in every corner of the country. His Excellency the President of the Republic of Uganda launched the census activities on 12th December 2023 and encouraged everyone to participate in the Census. A recorded message to all the people of Uganda was recorded and aired on Radio, Television and social media.

To ensure massive publicity of the census, various promotional contents, including talk shows, were frequently published in print, electronic and online media as well as telecast in various electronic media. In addition, census activities were regularly published on social media such as Facebook, WhatsApp, Twitter, YouTube, Instagram among others. The Countdown time to the census was also frequently advertised in the print media. A firm was hired to steer and monitor use of social media for the youth during publicity.

The Government of Uganda, through the National Census Council, and Census Steering Committee contributed immensely to the success of the enumeration exercise by (i) providing extra enumerators to finalise Greater Metropolitan Kampala and other areas which were lagging behind, and (ii) providing transport logistics for delivery and retrieval of materials from the Districts, Cities and Special areas, and creating a conducive environment across Government, before, during and after the Census.

B. The Enumeration Phase

The modalities of the enumeration phase included the following:

- 1. The Census Reference Night was the night of 9th May 2024.
- 2. The enumeration was done on a de facto basis i.e. every person was enumerated where he/she spent the Census Reference Night.
- 3. The actual enumeration started on 10th May and continued to 19th May 2024. However, in some areas such as Greater Kampala and other up-country districts that started late, an extra seven (7) days (20th 26th May) were added to mop up areas that had not been enumerated during the official enumeration period.
- 4. Identification of the enumeration areas using digital maps was based on the Global Positioning System (GPS) location.
- The enumeration process was a door-to-door exercise, using tablets and Computer Assisted Personal Interviews (CAPI). The field management processes, including monitoring of data, field staff performance and other quality control processes were also automated.
- Deployment of the electronic devices started with provisioning. The process involved installing the data collection application, Maps, Manuals and other relevant software for the field.

- 7. Access to the enumeration application was by use of login credentials generated through the e-recruitment system.
- 8. Trained enumerators moved from door-to-door within the assigned parish/ward and administered the questionnaire to the Head of household or any other knowledgeable household member. The enumerators also visited the respective institutions and accommodation facilities within the parish/ward while enumerating the population. Enumeration supervisors collected community information by conducting Focus Group Discussions (FGDs) and visiting respective service centers within the LCIs (villages/cells).
- 9. Special arrangements were made to enumerate institutions and floating population as well as guests in accommodation facilities. The floating population was enumerated on the night of 9th May 2024.
- 10. Phone numbers of selected census staff were circulated to all Higher Local Governments to provide quick solutions to various problems arising at the field level during data collection and to ensure direct interaction between Bureau staff and the public.
- 11. Supervision areas for IT and Data Management staff were created. UBOS deployed IT staff to manage the sub regions by supporting all the CCRs and District/City/Special area staff.

Quality Assurance and Control

To ensure high quality data and statistics that meet user expectations are compiled from the NPHC 2024, comprehensive quality assurance was conducted for the critical phases in the data value chain along the dimensions of quality of relevancy, methodological soundness, accuracy, timeliness, coherence and comparability and accessibility in addition to the institutional environment to ascertain that that the resources (human, financial and technological) available were sufficient to produce quality statistics.

For the data collection tools (questionnaires), reviews were conducted to ascertain that the needs of the various development frameworks, policies and strategies at both National and international level were taken into consideration during development. To ensure proper planning and deployment of enumerators, quality assessment for TPK Enumeration Areas maps was undertaken. Further, the tablets and all the supporting systems for data collections including functionality, data transfer and management procedures and protocols were also tested.

The use of CAPI and tablets, as a data quality control mechanism allowed for data monitoring during the data collection exercise. To enhance the quality of data from the field, in built data editing checks were developed and implemented. The Census Dashboard monitored all the data errors, inconsistencies, missing data and duplicates in real time and drew the attention of the field supervisors to any anomalies found, for further investigation and correction.

The data processing and analysis was assured in line with the recommended guidelines for methodological soundness that ensure that statistics accurately measure the population for Uganda and are completed and disseminated in the timely manner to support planning and development of the National Development Plan IV and related development frameworks.

Summarily, Quality assurance, monitoring and evaluation were integrated into every aspect of the NPHC 2024, with the work stream ensuring that all the plans relating to the exercise were implemented, monitored and evaluated to achieve complete coverage and generate quality data.

Risk and Compliance Management

The process of risk and compliance management was supervised by the Department of Risk and Compliance Management. Each Census Team Leader undertook Risk assessments and treatment plans were prepared for each risk profiled. The assessed risks were managed effectively as planned. The Census risk register was prepared, and risk matrix were well documented in the NPHC 2024 Risk and Compliance Management Plan. The Risk and Compliance Department harmonized and profiled all the risks for the Census. The matrix was regularly updated, presented in the monthly then weekly Census Management Team meetings were discussed and actions required followed up. The risk matrix was further regularly presented to the Board Risk and Compliance Committee, discussed and corrective actions implementation followed up. The Board Chair was updated on weekly basis from the quarter before enumeration exercise on the status of risks and census implementation for Board information and further support required.

Release of the Preliminary Results report

The NPHC 2024 Preliminary results were released on 27th June 2024, a month after the end of the data collection exercise on 26th May 2024. The use of digital equipment through which each enumerator synchronized data straight to the head office, eliminated the data entry and preliminary editing processes, and facilitated timely compilation of the preliminary results.

The preliminary results provided population counts, disaggregated by sex, at national, regional, and district levels.

C. The Post-Enumeration Phase

The post-enumeration activities that have been conducted include retrieval of all electronic devices from the District/City/Special Area headquarters back to the UBOS headquarters, Data processing, analysis and dissemination of this Main report, wall charts, and fact sheets, census maps/atlas, census dashboards, census database, press releases, media briefs and other products.

Data Editing

Data quality checks were embedded in the NPHC 2024 data processing system at various stages. Validation rules were developed and embedded in the data capture application before the main data collection activity. The application had some mandatory fields of age, date of birth and sex of the individual. Other checks included skip patterns and coding.

The second stage was office editing. Census data suffers from many sources of error that are classified generally as content and coverage errors. Content errors include, for example miscoding of responses. Coverage errors include errors of omission or duplication of persons. The use of electronic data collection systems eliminates some of these errors, but they are not totally eliminated from the NPHC data set.

A set of data editing guidelines was developed by the subject matter specialists. A computer editing program using CsPro was developed with guidance from a Consultant, based on the editing guide. Testing of the editing process was undertaken using a sample data set. Discussions were conducted with the subject matter team and the Consultant to guide the process. Field check tables were generated to test and check for validity.

The Post Enumeration Survey

A Post Enumeration Survey (PES) was conducted during the month of August 2024, covering 1000 EAs. The objective of PES was to measure the content and coverage errors of the census and validate the NPHC 2024 process. The final report will be released before the end of 2024.

Compilation of the Main report

The NPHC 2024 Main report has been released on 3rd October 2024, four (4) months following the end of the data collection exercise on 26th May 2024. The timely dissemination of these findings has been made possible due to the digital census, which eliminated the data entry and preliminary editing processes. In addition, a fully equipped data center was established at the Bureau offices, both in Entebbe and at Head Office manned by highly technical personnel to ensure timely delivery of the report.

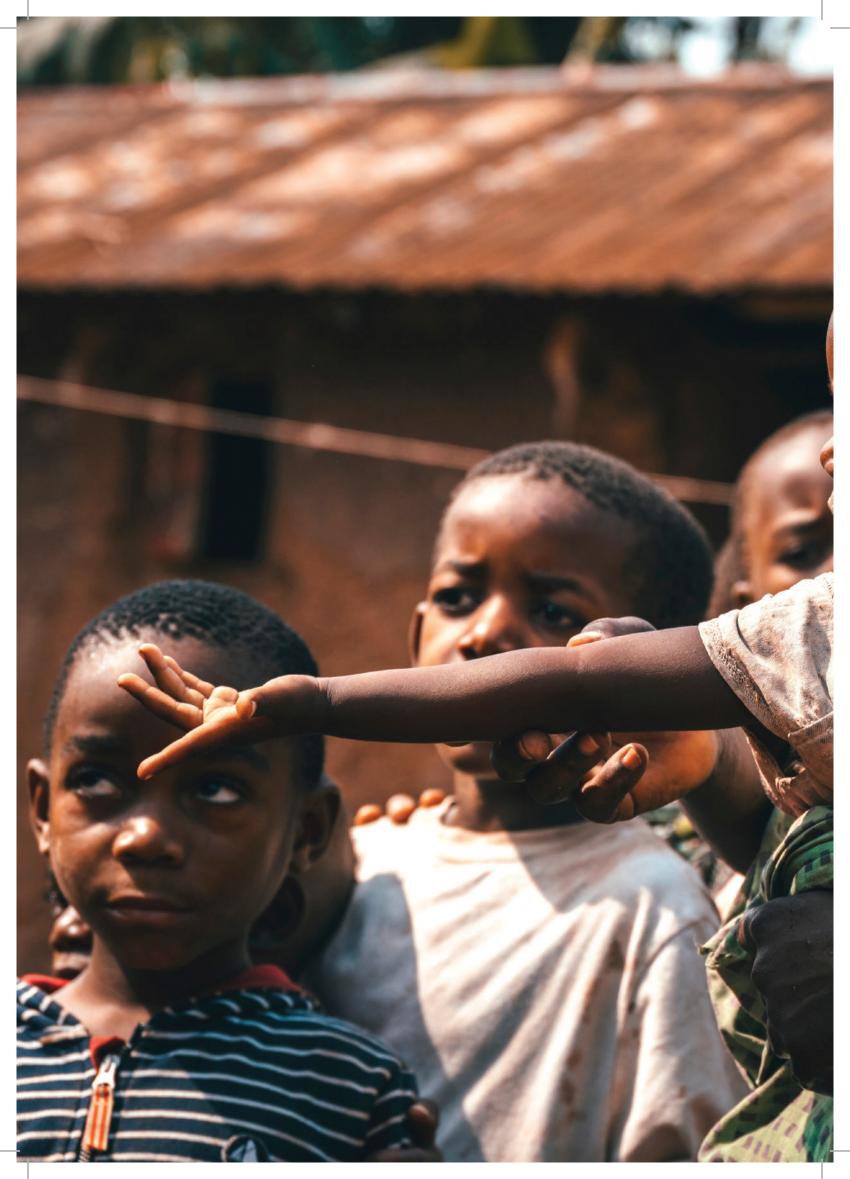

The main report provides detailed findings on population size and distribution, population composition, Education and Literacy, selected health indicators, Information and Communication Technology, Fertility, Mortality, Labour force, Housing and Household characteristics, Household welfare and subsistence economy, access to financial services, and the first ever Census based findings on Disability Prevalence for Uganda and Food Insecurity Experience Scale (FIES) at household level.

Other activities

Other post-enumeration activities to be conducted include development of a geo-referenced database, thematic reports, District and Constituency profiles, and many other Census products.

POPULATION SIZE AND DISTRIBUTION

Key Findings

- Total Population: Uganda's total population was 45.9 million people as at May 2024 with 21.6 million males and 24.3 million females.
- **The Population growth rate** dropped slightly from 3.0 percent in 2014 to 2.9 percent in 2024.
- **Population distribution:** Buganda sub-region had the largest population of 13.0 million persons, followed by Busoga (4.4 million persons). Karamoja sub-region had the smallest population of 1.4 million persons.
- Population density: Uganda's Population Density as of 2024 was 224 persons per square kilometer, an increase from 123 people and 173 people per square kilometer in 2002 and 2014 respectively.
- **Daytime Population in the Cities:** This stood at 4.2 million persons with the highest share in Kampala Capital City (42.8%) and the least daytime population in Soroti city (3.2%).

nformation about the country's population size, growth and distribution are critical statistics that enable governments make informed decisions, plan effectively and monitor development. A good understanding of population trends and its distribution is essential in assessing development and service delivery.

The chapter presents information on the country's population size and distribution based on the National Population and Housing Census (NPHC 2024) and an analysis of trends from previous censuses.

2.1 Population Size

Figure 2.1: Total population by Census year, 1969 - 2024

The total population of Uganda was 45.9 million people in May 2024. This represents an increase of 11.3 million people from the NPHC 2014. Figure 2.1 indicates that Overall, there is a steady increase in population size over the years from 1969 to 2024.

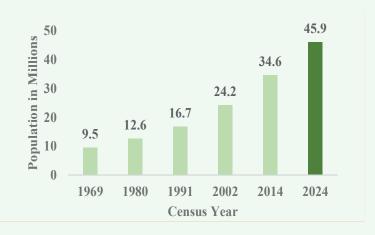

Figure 2.2: Population size and average annual growth rates, 1911-2024

Figure 2.2 provides more insight into the population growth by male and female, average annual growth rates from 1911 to 2024. It shows a consistent growth in both male and female populations from 2.9 million people in 1921 to 45.9 million people in 2024, there are varying rates of increase over the different census periods (Table 2.2).

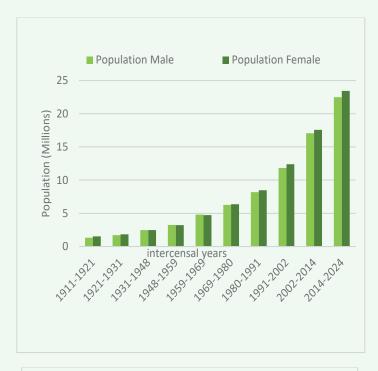

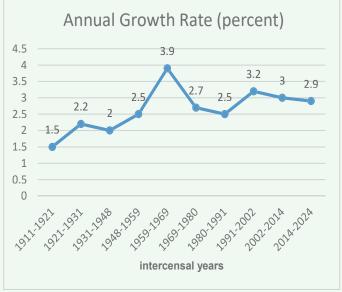

Figure 2.3: average annual growth rates

Figure 2.3 shows the population growth rate dropped slightly from 3.0 percent in 2014 to 2.9 percent in 2024.

2.2 Age sex composition

Age and sex are two attributes valuable for taking stock of the current state of the population that largely influence an individual's role in a society. They are the basic characteristics or biological elements of any demographic group and these influence fertility and mortality, migration, marital status, and economic activity status among other characteristics. Age specific data is important for various demographic indicators since it enables us to highlight future social and economic trends and provides the state with information to inform policies and support prevention programs for specific age groups and sex that is at risk.

2.2.1 Reliability of the Sex and Age data

Age data collected in a census is not necessarily accurate. This is because some respondents do not know their age and some report ages. In particular, the concept of age heaping is well documented by demographers. This is where ages that end in 0 and 5 are preferred. There are methods of detecting how much this digit preference affects the quality of the data. We evaluated the quality of age data in this report using the Myer's Index. The index returns a negative figure if a digit is avoided and a positive if it is preferred.

Figure 2.3 shows extensive heaping for ages ending in digit 4 in 2024. Heaping is also observed for ages ending in digits 0, 5 and 8 with digit 0 being preferred more than 5 and 8. The remaining digits were avoided with digit 1, 2 and 6 being most avoided. (Figure 2.4).

Figure 2.4: Myre's Index of Digit Preference

One of the other measures for data reliability is the UN age sex accuracy index (UN Joint Score). The UN age sex accuracy index is developed based on sex ratios and age ratios, computed for five-year age groups, up to age 70. If the joint score is less than 20 (low range), the data is described as reasonably reliable; between 20 and 40 (cautious range) implies the data is fairly reliable; over 40 (high range) implies the data is quite unreliable. Figure 2.6 shows a reported index of about 27 which implies that the quality of the age-sex data from the Census 2024 was fairly reliable.

Reliable Usable Deficient == Erroneous — Joint Score — Ramachandran Modification 100 90 80 70 60 50 40 31.08 26.79 30 20 23.56 19.27 10 0 2024 2014

Figure 2.5: UN Joint Score

2.2.2 Age Distribution

Age data is fundamental to majority of the characteristics collected in the census. The age distribution is the proportional number of persons in successive age categories of a population. It reflects the past fertility and mortality behavior of the population. In the absence of high migration or drastic changes in births and deaths, the young population is expected to be more than the older population. The NPHC 2024 results indicate that the younger population constitutes a high percentage of both males and females and the age has relatively followed a declining trend as indicated in Table 2.4.

A population pyramid is a graphical presentation of age and sex composition of a population. It is a reflection of the past and current fertility patterns. Uganda has a largely young population as shown by the broad base of the pyramid (Figure 2.7).

The pyramid shows the expected pattern of declines in the length of the bars for each group with advancing age.

The narrow top indicates that there are few elderly persons, illustrating slightly shorter life expectancy with advancement in age.

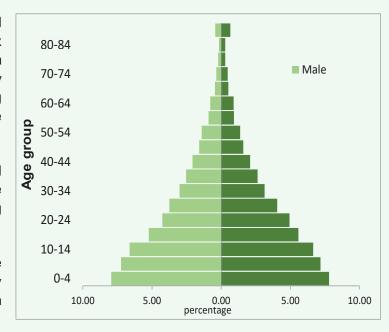

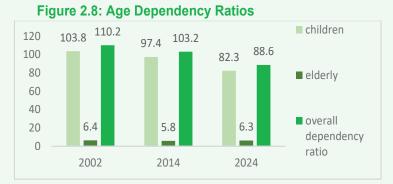

Figure 2.7: Population Pyramid

2.3 Age Dependency Ratios

Age-dependency ratio is an indicator of the economic burden that the productive population must bear. Populations with very high birth rates coupled with low death rates have a high age dependency ratio.

Overall, the age dependency ratio was 89 percent with 82 percent child dependency and 6 percent for elderly dependency. This implies that for every 100 working age individuals, there are 89 dependents (Figure 2.8).

2.4 Population distribution

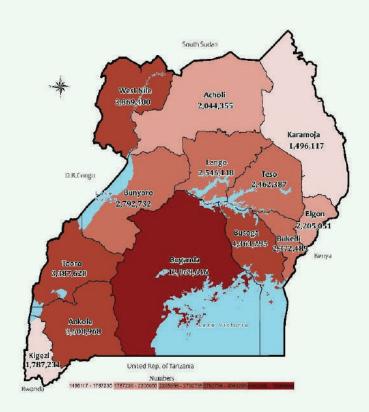

Population distribution refers to the way people are spread over a specific geographical area. It provides information on the number of individuals living in different parts of the area and this helps to understand the patterns of settlement. The distribution can be clumped, uniform, or random. A clumped distribution indicates a high population density in an area.

Figure 2.9 Population Distribution by Sub region

According to figure 2.9, the population distribution for Uganda continued to show regional changes with Buganda sub-region having the largest population of 13.0 million persons, followed by Busoga (4.4 million persons) and Karamoja sub-region having the smallest population of 1.4million persons (Table 2.1).

Population distribution by the most and least populated Districts

Wakiso district was the most populated with over 3.4 million people followed by Kampala with over 1.9 million people whereas Moroto and Kalangala districts were the least populated with 103,344 and 70,589 people respectively (Table 2.5).

2.5 Population density

Population Density is a measure of the degree of population concentration in an area. It is derived as a ratio of the total population of a given area to the total land area expressed in square kilometers. Population density indicates population growth.

The Population Density of Uganda according to NPHC 2024 was 224 persons per square kilometer as indicated in figure 2.10. There has been a gradual increase in population density across the census years since 1991 from 85 to 224 people per square kilometer. Population Density by district varies widely between 9,619 square kilometers for Kampala and 29 square kilometers for Moroto District as indicated in figure 2.10.

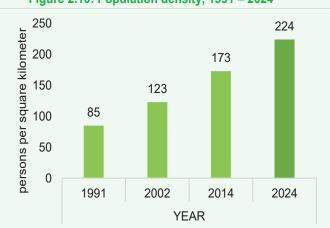

Figure 2.10: Population density, 1991 – 2024

2.6 Household and non-household population

A household consists of a person or group of persons, related or unrelated, who LIVE together in the same dwelling unit AND EAT together. Households are the centre of demographic, social and economic processes. Decisions about childbearing, education, health care, consumption, labour force participation, migration, accessing financial intermediaries, among others, occur at the household level. Understanding the patterns of household size and consumption can inform efforts towards the achievement of national and international agenda

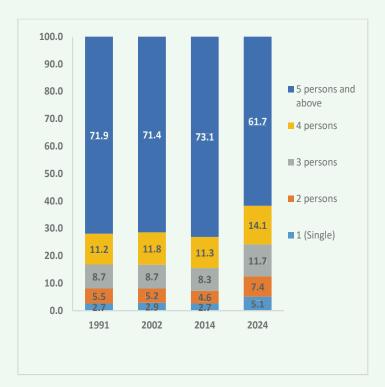

2.6.1 Household Population and household size

Average household size is a measure of the number of persons per household and is obtained by dividing the total household population by the number of households in a specified study category.

Out of the 45.9 million persons enumerated, 45.5 million (99 percent) were enumerated in private households and the remaining in (1 percent) in hotels, institutions or as homeless/floating population. The total number of households enumerated in the NPHC 2024 was 10.6 million households and the mean Household size was 4.2 persons and has declined from 4.7 persons that was recorded in 2014 (Table 2.8).

Figure 2.11: Distribution of household population by size (%), 1991-2024

There was an increase in the households with one, two. three and four household members, whereas households with more than five members reduced to 61.7 percent. The average household size for Uganda as per the NPHC 2024 was 4.2 persons compared to 4.7 persons in 2014 (Figure 2.11).

2.6.2 **Non-Household Population**

Out of the 45.9 million persons enumerated in Uganda, 1.5 million were not enumerated in households and hence classified as non-household population. Figure 2.12 shows that majority of this population (1.3 million) was enumerated as floating population found on the streets, bus parks and in transit on the census night.

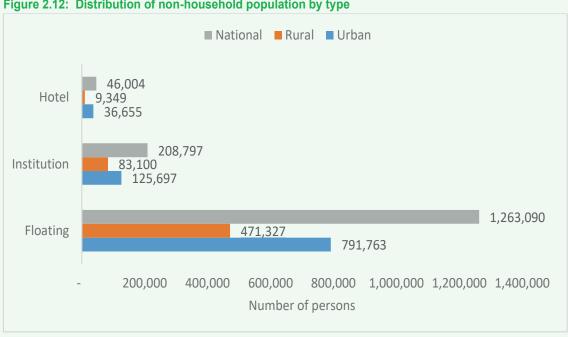

Figure 2.12: Distribution of non-household population by type

2.7 Daytime population in the cities

The NPHC 2024 included a set of questions to collect daytime population for cities, whether a person had visited any city during the daytime during the previous 2 weeks to census enumeration. Additional information on the main purpose of the visit was collected including number of days spent. The results are shown in Table 2.8. The total day time population within the eleven cities of Uganda stood at 5.5 million persons. The highest daytime population was recorded in Kampala Capital City at 2.5 million people, followed by Arua City at 440.540 people. (Table 2.8).

POPULATION COMPOSITION

Key Findings

- Religious Affiliations: Catholics and Anglicans constituted half (67%) of the population of Uganda. Catholics constituted 37 percent of the population
- Current marital status: 61 percent of women and 51 percent of men age 15+ were currently married or living together with their partner as though married
- Birth Registration:

Long Birth Certificates: 11.4 percent of the population have long birth certificates

Birth Notifications: 28 percent of the population had short birth notification records.

• *No birth certificate and short certificate*: 56.8 percent were neither notified nor registered.

Population composition refers to the demographic makeup of individuals within a specific geographic area. This composition describes the characteristics of a population in terms of factors such as age, sex, marital status, religious affiliation, tribe and nationality and so on. This chapter profiles the composition and characteristics of the census population to inform decision making in the country

3.1 Religious Affiliations

Religion is a system of beliefs, practices and rituals that provide a sense of meaning, purpose and connection to something greater than oneself.

Religion plays a vital role in shaping individual and collective identity. In Uganda, religion is a significant aspect of daily life influencing culture, social norms and community dynamics.

This section examines the distribution of different religious affiliations including Christianity, Islam, traditional religions among other faiths and explores the demographic and geographic characteristics of the

adherents. By examining religious diversity of the population, this section aims to provide insights that can inform policy, promote interfaith understanding and social cohesion.

Figure 3.1 reveals that Roman Catholics constitute the largest religious denomination accounting for 37 percent of the population, followed by Anglicans/ Church of Uganda at 30 percent. Notably, the Pentecostal/ Evangelicals have experienced an increasing from 11 percent in 2014 to 15 percent in 2024; this growth is attributed to the persons aged 20-29 who made the biggest proportion (xx). Religious affiliation is a core attribute of Uganda's population with only 0.2 percent stating that they had no religion. Christianity was predominant accounting for 86 percent of the total population.

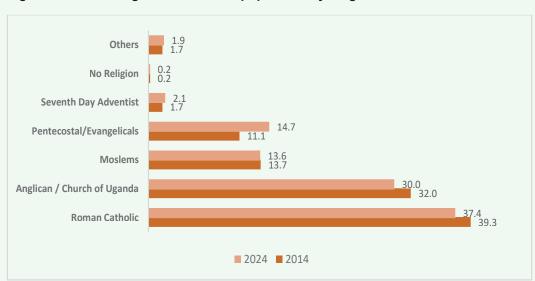

Figure 3.1: Percentage distribution of population by religious affiliations

Table 3.2 presents the distribution of the population by religious affiliation and sub regions. Karamoja sub region had the biggest percentage (76%) of its population religiously affiliated to the roman Catholics followed by Acholi sub region at 64 percent. Kigezi sub region has the biggest proportion (50%) of people religiously affiliated to Anglican religious faith. The biggest percentage (30%) of Muslims is found in Busoga sub region while the least percentage (1%) of Muslims is found in Karamoja sub region. Religious affiliation was almost universal in Uganda with only 0.2 percent stating that they had no religion.

3.2 Nationality and Tribe

Nationality is the status of a person that is recognized by law as being a member of a particular nation by origin, birth or naturalization.

Tribe is a group of indigenous persons, families or clans believed to be descendent from a common ancestor and forming a close-knit community under a defined leader, chief or ruling council.

The term **Ethnic Minorities** in Uganda connotes three issues – a small population, marginalization and the lack of participation or inclusion in State systems.

Almost all (99%) persons enumerated on the census night were Ugandans as shown in table 3.3.

Table 3.4 shows the trends of the thirteen ethnic groups that had a population of more than one million each in 2024. The Ugandan population is made of several ethnic groups, with the Baganda maintaining the status of being the largest ethnic group since the 1948 census. In 2024 the Baganda comprised 16 percent of the indigenous population, a reduction of one percentage point from the 2014 Census. Generally, all the thirteen major ethnic groups maintained their share of the population in Uganda between 2014 and 2024, apart from the Iteso who overtook the Bakiga. The population of the Iteso became the 4th in 2024 from 5th largest in 2014 overtaking the Bakiga.

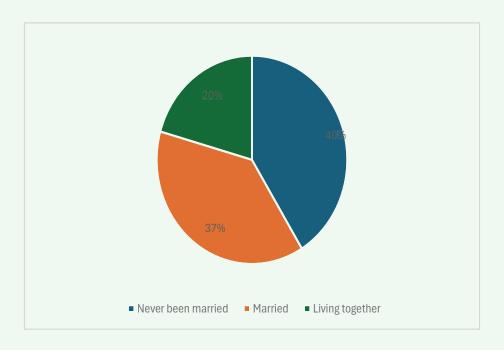

Table 3.5 shows that the most dominant ethnic minority group were the Bakenyi (101,395) and the least were the Mvuba (382).

Table 3.6 shows distribution of tribes by religion. The Napore tribe which has the highest share of her population (94%) as catholics while majority (66%) of the Batuku tribe are Anglicans. Table 3.7 presents findings by tribe and subregion. Nearly 2 in 10 (19%) of the Batwa were living within Buganda subregion and (77.2%) of the Banyarwanda were in Buganda subregion at the time of enumeration.

3.3 Marital Status

Marital status is the legal or social status of an individual in relation to marriage laws or customs of Uganda. Marriage is a union between two people that is recognized by law, custom, religion or tradition and is characterized by mutual rights, obligations and responsibilities. This section examines the distribution and characteristics of Uganda's population by marital status, including never married, married, divorced, separated, and widowed. Table 3.8 shows that about 40 percent of the population aged 10 years and above has never been married while 37 percent were married (Church/Temple, Islamic, Civil, Hindu and customary) and others living together/cohabiting (20%). Figure 3.2 shows the population aged 10 years and above by marital status. See Table 3.9 and 3.10 for details by other background characteristics.

3.4.1: Singulate Mean Age at Marriage (SMAM

The Singulate Mean Age at Marriage (SMAM) is the average length of single life expressed in years among those who marry before age 50. This is a synthetic indicator calculated from marital status categories of men and women aged 15 to 54 at the census date (10th may, 2024)

In Figure 3.3, the SMAM is generally higher for males than females in all subregions of Uganda. Ankole sub-region has the highest difference of 3.7 years and Ankole subregion has the highest Singulate Mean at Marriage of 25 years among the males and 21 years among the women. Bunyoro has the lowest SMAM for the females (20) years. Table 3.11 provides SMAM by sex and subregion.

Figure 3.3: Singulate Mean Age at Marriage by sub-regions.

3.5 Birth Registration

Birth registration

Process by which a child's birth is recorded in the Civil Register by the government authority, National Identification and Registration Authority (NIRA).

Every child has a right to a name and nationality. This is free, accessible to all, and conducted for each newborn child immediately or as soon as possible after birth. Birth registration enables an efficient government to determine the number of children born in a year and therefore plan the number of schools, health centers and other services required. On national level, a complete registry of births is essential for effective demographic data base and resource planning.

Eleven percent of the total population were registered with National Identification Registration Authority and have acquired a long certificate while 28 percent acquired birth notifications and are in the process of being registered. Fifty-seven percent of the total population were neither notified nor registered. (Figure 3.4).

There is a slight variation of population registered with a long birth certificates across region with Buganda (14.9%) registering the highest proportion and Teso (7.6%) registered the lowest percentage of population with Long certificate (**Table 3.12**)

Figure 3.5 Birth registration by region Percentage of population with a long certificate

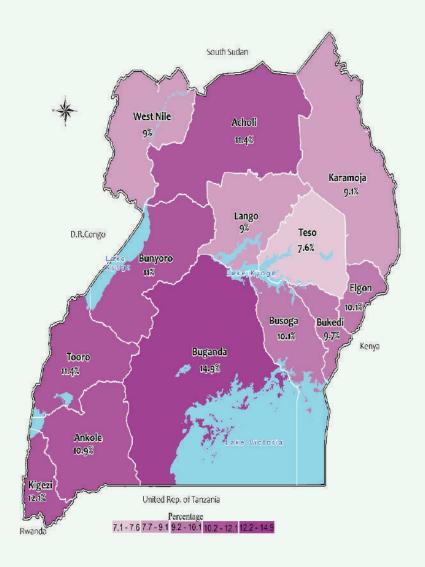

Figure 3.4 Percentage distribution of population by Birth registration

For more information on population composition, refer to the tables below.

EDUCATION AND LITERACY

Key Findings

School attendance:

20% of the population aged six years and over had never been to school by the census year.

Gross attendance ratios (GAR):

Gross Attendance Ratio for primary schools was 101.3% and 32% for secondary schools.

Net Attendance Ratios (NAR):

Net Attendance Ratio for primary schools was 66.8 percent and 22.3% for secondary schools.

Education attainment:

The majority of Ugandans have either only some primary education or no formal education, about 30% attained some primary-level education

Literacy: Nearly 8 in 10 males (76.6%) and 7 in 10 (71.6%) females were literate.

Adult literacy: 73.7% of the population aged 18 years and above was literate

he Education sector is key in promoting sustainable development through human capacity development of the population in various skills, raising awareness on various issues of national importance and improving general standards of living. The education system aims at training children and adults in a range of skills from basic education to professional development. The country is targeting improving learning outcomes in basic competencies, especially literacy and numeracy, for all children.

Uganda's education system includes formal and informal education. This chapter explores the education status of Uganda's population with a major focus on formal education system.

Formal education refers to every category of education where a curriculum recognized by the Ministry of Education and Sports is followed; and a certificate that is recognized by the Ministry is awarded to students upon completing the course being studied. This includes technical and vocational training institutions beyond primary school level.

This however does not include Bible or Koranic trainings. Other alternative education systems such as FAL (Functional Adult Literacy), ABEK (Alternative Basic Education for Karamoja) and COPE (Complementary Opportunities for Primary Education) were not considered as formal schooling.

The NPHC 2024 focused on measuring the current school attendance and educational attainment of all household members aged 3 years and above. Education level attained was categorized along the respective levels of education as follows: pre-primary education, primary education, secondary education and post-secondary education.

4.1 Distribution of Uganda's School-Age Population

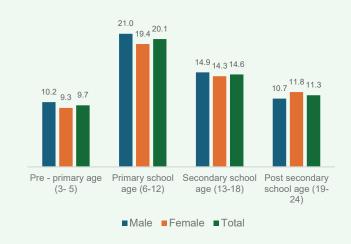

According to the education system in Uganda, a child is expected to enrol for primary education at the age of six years, and complete post-secondary education at the age of 24 years. The regulation of Early Childhood Development (ECD) programmes is one of the NDP III strategic interventions to achieve equitable access to relevant and quality education. This calls for the inclusion of the population aged 3-5 years to cater for the Early Childhood Education, which is also known as pre-primary education in Uganda. Therefore, Uganda's school-age population consists of persons aged 3 to 24 years.

According to the NPHC 2024 results, 57 percent of the total population were in the school-age population as shown in Table 4.1.

Further analysis showed that about 10 percent of the total population were in the pre-primary, 20 percent in the primary, 15 percent in the secondary, and about 11 percent in the post-secondary school age population.

As shown in Figure 4.1, except for those aged 19-24 years, the male school-age population was slightly higher than that of the females. However, the variation was minimal across the categories, with a less than two-point percentage difference.

Fig. 4.1: Distribution of the School-age Population, by Sex and Age Group

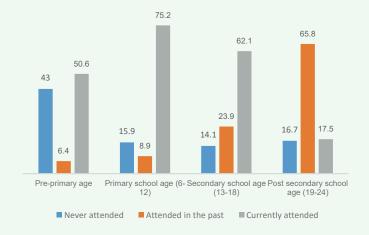

4.2 School Attendance Status

The NPHC 2024 categorized school attendance status into 3 groups: currently attending school (in 2024), attended in the past and never attended.

Results showed in Figure 4.2 show that the highest percentage of learners who were currently attending school in 2024 was among the primary school going age (75%); followed by that of the secondary school going age (62%). The lowest was among the post-secondary school going age (18%).

Fig 4.2: Percentage of Population aged 3-24 years, by school Attendance status

Generally, the percentage of those currently attending school across the various categories decreases with progression to the next level of education.

4.3 Current School Attendance

School attendance is defined as being in school at any regular recognized educational institution or programme, public or private, for organized learning at any level of education. It is measured using Gross Attendance Ratios and Net Attendance Ratios.

Gross Attendance Ratios (GAR)

The total number of children attending primary school divided by the official primary school age population and the total number of children attending secondary school divided by the official secondary school age population

Eligibility: Children aged 6-12 for primary school GAR and children aged 13-18 for secondary school GAR

Net Attendance Ratios (NAR)

Percentage of the school-age population that attends primary or secondary school.

Eligibility: Children aged 6-12 for primary school NAR and children aged 13-18 for secondary school NAR

4.3.1 Early Childhood Education Attendance

In Uganda, the Ministry of Education and Sports, through the Early Childhood and Care Education (ECCE) Policy recognizes that access to quality ECCE is critical for sound intellectual, psychological, emotional, linguistic, social and physical development and lifelong learning. ¹ Early Childhood Education (ECE) is the most important stage of development in a child's education cycle; since it increases their opportunity to perform better in school and in life. In Uganda, ECE is commonly termed as nursery schooling and is also referred to as pre-primary schooling.

Attendance to Early Childhood Education

Number of children attending an Early Childhood Education program

Eligibility: Children aged 3-5 Years

During the NPHC 2024, responses were obtained for all persons aged 3-5 years, to establish whether they attended any schooling during the 2024 school year and what class/grade they were attending. The children who attended nursery school, in baby, middle and top classes, were classified as being in ECE.

The results presented in Figure 4.3 show that overall, 40 percent of the children aged 3 to 5 years were attending ECE in 2024. The results further indicate that 41 percent of the female children aged 3 to 5 years were in ECE, compared to their male counterparts (40%).

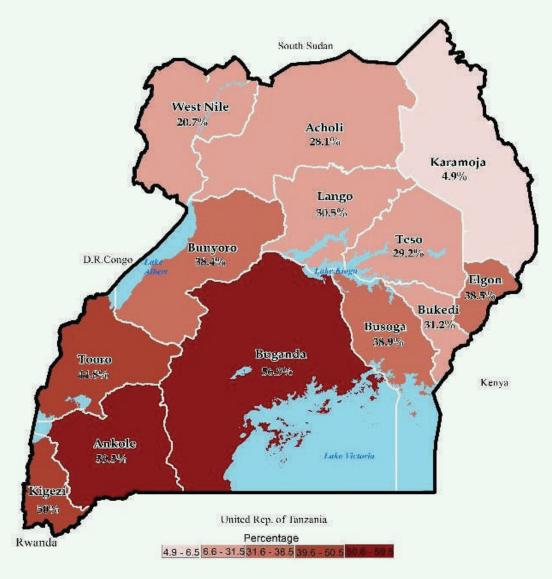

Figure 4.3: Children Currently Attending ECE by Sex, 2024

¹ Ministry of Education and Sports (2018). The Early Childhood Care and Education Policy

The analysis of ECE attendance has been presented at sub-regional level in Figure 4.4. Buganda sub-region had the highest ECE attendance (57%) whereas Karamoja sub-region had the lowest (5%). Generally, most of the sub-regions in the eastern and northern parts of the country had less than 40 percent of the children in ECE as compared to those in Central and Western Uganda.

Figure 4.4: Percentage of the Population Aged 3-5 Years Currently Attending ECE, by Sub-region

4.3.2 Primary School Attendance

During the NPHC 2024, responses were obtained for all persons aged 6-12 years, to establish whether they attended any schooling during the 2024 school year and what class/grade they were attending. The persons who attended primary one to primary seven, were classified as being in primary school. The primary school GAR refers to the total attendance in primary school, regardless of age and grade, expressed as a proportion of the official school going age population (6-12 years).

The NPHC 2024 results indicate that the primary school GAR at the national level was 101.3%, with a slight variation between males (102%) and females (101%). The primary school NAR refers to the proportion of the total attendance of eligible official school age population (6-12 years) to the corresponding age group.

The results show that the primary school NAR at the national level was 67%, with a slight variation between males (66%) and females (68%). By sub-region, Teso sub-region had the highest NAR of 75.6 percent and Karamoja sub-region had the least NAR at 24.4 percent as seen in **Figure 4.6.**

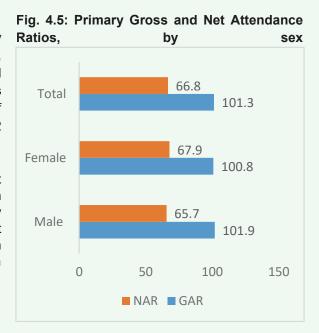

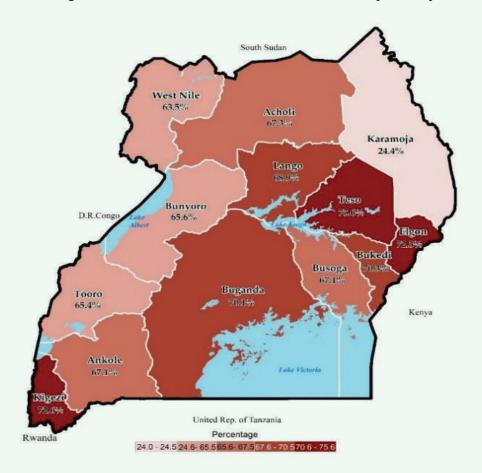

Figure 4.6: Percentage distribution of Net Attendance Ratio at Primary level by Sub-region

4.3.3 Secondary School Attendance

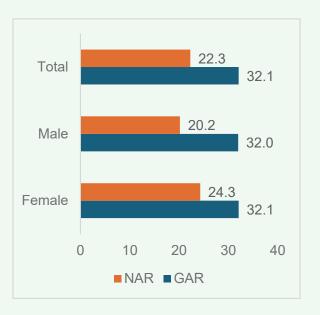

The official secondary school going age is 13 to 18 years. During the NPHC 2024, responses were obtained for all persons aged 13-18 years, to establish whether they attended any schooling during the 2024 school year and what class/grade they were attending. The persons who attended senior one to senior six were classified as being in secondary school.

The secondary school GAR refers to the total attendance in secondary school, regardless of age and grade, expressed as a proportion of the official school going age population (13-18 years).

The NPHC 2024 results indicate that the secondary school GAR at the national level was 32.1, as indicated in **Figure 4.7**. The results further show that there was no difference between the GAR for the males (32%) and females (32%). The secondary school NAR refers to the proportion of the total attendance of eligible official school age population (13-18 years) to the corresponding age group.

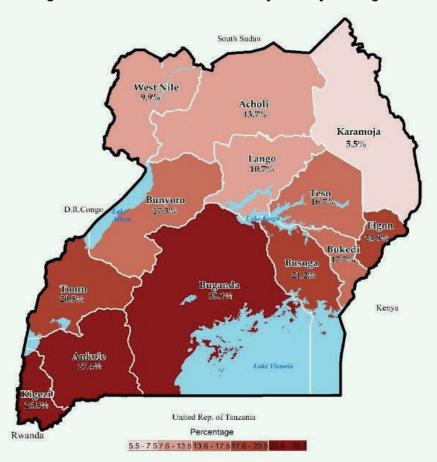

The secondary school NAR at the national level was 22%. The results further show that there was slight variation in the NAR between males (20%) and females (24%).

Fig. 4.7: Secondary Gross and Net Attendance Ratios, by sex

Buganda sub-region had the highest NAR of 35.1 percent and Karamoja sub-region had the least NAR at 5.5 percent as seen in **Figure 4.8.**

Figure 4.8: Percentage distribution of NAR at secondary level by sub-region

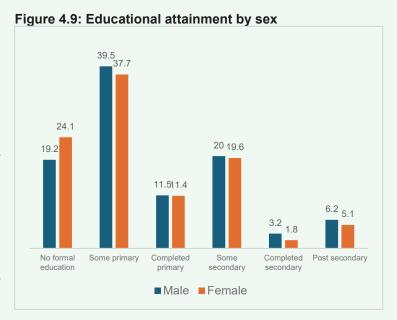

4.4 Education Attainment

The NPHC 2024 collected information on education attainment by asking the highest grade/class completed for all persons aged 10 years and above. Education attainment refers to the highest level of education an individual has completed.

4.4.1 Highest Class/Grade Completed

Table 4.4.1 presents the distribution of the population aged 10 years and above by grade/class completed. About twenty-two percent of the population aged 10 years and above had no formal education while only about 39 percent attained some primary-level education. Only 7 percent of the population had attained post-secondary level of education.

The results also show that Nineteen percent of males and 24 percent of females had no education. Only five percent of women and six percent of men had completed tertiary education (Figure 4.9).

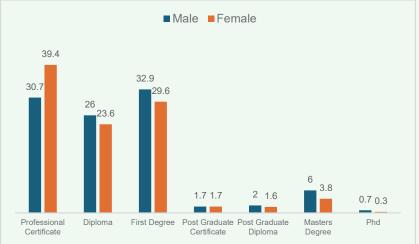

4.4.2 Post-Secondary Education attainment

NPHC 2024 results indicate that seven percent of the population aged 18 years above had post-secondary as shown in **Figure 4.10**.

As regards education qualification level about 33 percent of the males had attained a first degree compared to their female counterparts (30%)

4.5 School attendance status and disability

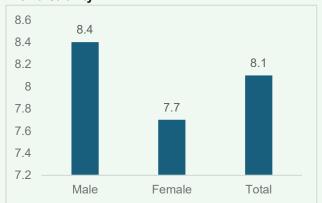

Persons with disabilities face challenges of accessing appropriate education services, particularly in the early childhood period. Having a disability is one of the causes for never attending school and dropping

out among persons with disabilities since they are vulnerable. The NPHC 2024 collected data on different types of disability for persons aged two years and above.

Of the total number of pupils that were currently attending school in 2024, about 8 percent had a disability

The findings further indicated a slight variation between the male (8.4%) and female pupils (7.7%) as shown in **Figure 4.11**.

Figure 4.11: Primary school attendance for pupils with disability

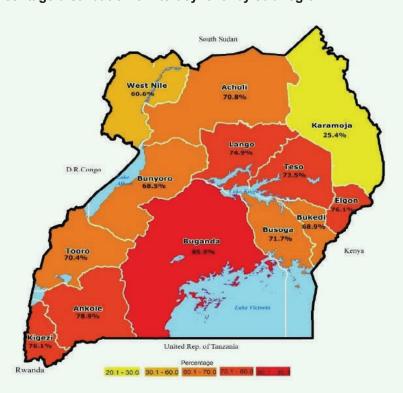

4.6 Literacy

Literacy is defined as the "ability to read with understanding and write meaningfully in any language". The NPHC 2024 collected information on the literacy status of household members aged 10 years and above. **Table 4.5** shows that overall literacy rates was 74 percent. The males had a slightly higher literacy rate (77%) compared to their female counterparts (72%). There was a slight increase in the literacy rates from 72 percent in 2014 to 74 percent in 2024.

Buganda sub-region had the highest literacy rate (86%) while the Karamoja sub-region had the lowest literacy rate (25%). Ankole sub-region had 79 percent, while Kigezi and Elgon sub-regions had 76 percent each as shown in **Figure 4.12.**

Figure 4.12: Percentage distribution of literacy level by sub-region

4.7 Community Characteristics

Data on the education infrastructure within the communities, specifically parishes with primary schools and sub counties with secondary schools was compiled at the community level. The results have been presented in **Figure 4.13** to show the percentage of parishes with at least one primary school.

Availability of Primary Schools

Percentage of parishes with at least one primary school

Population: Total number of parishes

Results in **Figure 4.13** show that 74 percent of the parishes in the country had at least one government founded primary school. Also, 57 percent had at least one private school, and 19 percent had at least one religious school. Only four percent of the parishes in Uganda had an NGO founded primary school. Overall, 89 percent of the parishes had at least one primary school, irrespective of the founding body. Detailed results are presented in **Table 3.6**.

100 89.4 Percentage of parishes 74.1 80 57.2 60 40 19.3 20 10.5 3.8 0 Overall Government Private NGOs Religious Community Founding body

Fig 4.13 Parishes with a Primary School, by Founding Body (%)

Patterns by Background Characteristics:

As shown in **Figure 4.14**, Kigezi Sub-region has the highest percentage of Parishes with at least one primary school (96%). This is followed by Ankole (93%), Buganda (93%), and Busoga (92%). Acholi and Elgon sub-regions have the lowest percentage (83% and 82% respectively).

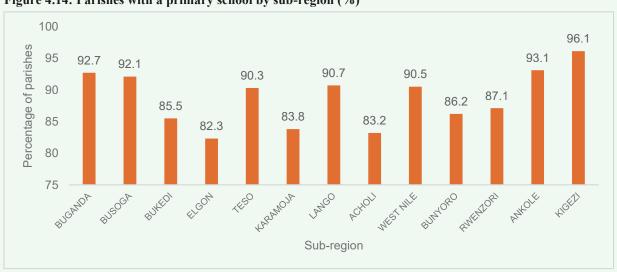

Figure 4.14: Parishes with a primary school by sub-region (%)

Availability of Secondary Schools

Percentage of Sub-counties with at least one secondary school

Population: Total number of Sub-counties

Results in Figure **4.15** show that 62 percent of the Sub-counties in the country had at least one government founded Secondary school. Also, 55% had at least one private school, and 22% had at least one religious secondary school. Only 6% of the Sub-counties in Uganda had an NGO founded secondary school. Overall, 71% of the Sub-counties had at least one Secondary school, irrespective of the founding body. Detailed results are presented in **Table 3.7**.

80 70.8 62.2 54.5 21.9 13.7 6 \cap Private NGOs Overall Government Religious Community Founding body

Fig 4.15 Sub-counties with a Secondary School, by Founding Body (%)

Patterns by background characteristics

As shown in **Figure 4.16**, Buganda and Ankole Sub-regions have the highest percentage of Sub-counties with at least one secondary school (86%). This is followed by Busoga (85%), Kigezi (82%), and Tooro (80%). Karamoja sub-region has the lowest percentage (25%) of Sub-counties with at least one secondary school.

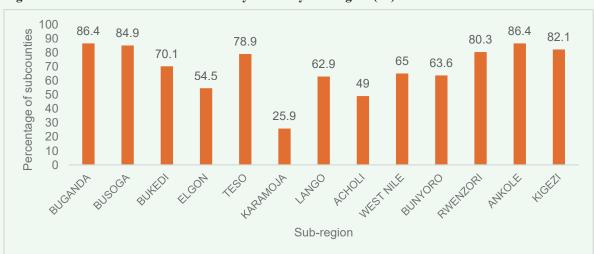

Figure 4.16: Sub-counties with a secondary school by sub-region (%)

Availability of BTVET Institutions

Percentage of Districts & Cities with at least one BTVET Institution

Population: Total number of districts

Business Technical Vocational Education Training Institution (BTVET) is a school, technical institute, college or center offering approved BTVET courses leading to the award of certificates or diplomas. The BTVET institutions knowledge, values and skills in specifically designed training areas to produce competitive workers to participate in sustainable growth and reduce poverty. (MoES, 2019, Parliament of Uganda, 2008)

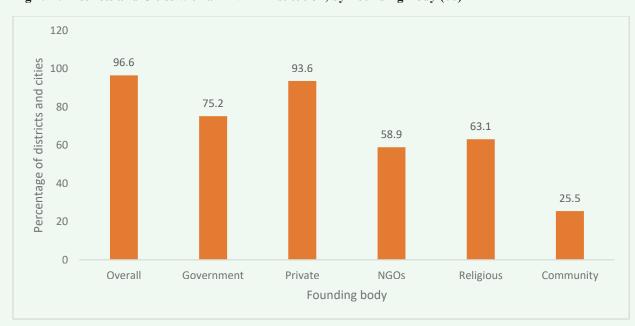

Fig 4.17: Districts and Cities with a BTVET Institution, by Founding Body (%)

As shown in **Figure 4.17**, 75 percent of the districts and cities in the country had at least one government founded BTVET institution. Also, 94% had at least one private BTVET institution, and 63%, a religious founded institution. Only 26% of the districts and cities in Uganda had a community founded BTVET institution. Overall, 97% of the districts and cities had at least one BTVET institution, irrespective of the founding body. Detailed results are presented in **Table 3.8**.

Patterns by Background Characteristics

As shown in **Figure 4.18**, all the districts & cities (100%) in the Sub-regions of Busoga, Bukedi, Teso, Lango, Acholi, West Nile, Bunyoro, Tooro, Ankole and Kigezi have at least one BTVET institution. At least 90% of all the districts and cities in Buganda and Elgon Sub-regions have a BTVET institution while it was the case for only 67% of those in the Karamoja.

Figure 4.18: Districts and Cities with a BTVET Institution, by sub-region (%)

INFORMATION AND COMMUNICATION TECHNOLOGIES

Key Findings

- Mobile phone ownership: In Uganda, 43 percent of individuals aged 10 years and above own a mobile phone, which equates to approximately 13.6 million people. Among these mobile phone owners, 37 percent possess one phone, while six percent own two or more.
- Fixed telephone line ownership: Eight percent of households in Uganda have fixed telephone lines.
- Ownership of computers and other ICT devices: Seventy-six percent of households had a member who owned a mobile phone, while 41 percent had a radio, 23 percent had a television, and four percent owned a computer.
- Computer use: In 2024, only four percent of individuals aged 10 and above used computers, including desktops, laptops, and tablets.
- Internet usage: In 2024, nine percent of individuals aged 10 years and above had access to internet facilities. The internet was primarily utilized for social networking (67%), academic work (16%), and business or office tasks (13%).
- Sources of information: Thirty-eight percent of households identified
 the radio as their primary source of information, followed by word of
 mouth at 22 percent, phone calls at 15 percent, and television at 14
 percent.
- Online services: In Uganda, about two percent of individuals aged 10 years and above accessed online government services, while about one percent used online shopping, online advertisements, and internet banking respectively.

nformation and Communication Technologies (ICT) are essential for fostering development and driving progress. They have the capacity to significantly enhance productivity across sectors by streamlining government operations and improving business efficiencies, which in turn increases competitiveness in the global market. As a result, ICT is a key factor in advancing social and economic growth. However, as the technological landscape evolves rapidly, it is imperative for the government to proactively adapt by formulating innovative strategies that will help shape the nation's digital landscape and secure a thriving future.

Agenda 2030 aims to enhance access to information and communications technology (ICT) and ensure affordable internet for all under Sustainable Development Goal 9. Similarly, Goal 17 promotes the use of enabling technologies. African Union Agenda 2063 targets doubling ICT penetration and its contribution to GDP, while the EAC Vision 2050 seeks to strengthen ICT capabilities to drive innovation and competitiveness. The Uganda Vision 2040 highlights ICT as essential for transforming the country into a modern and prosperous society.

As digital literacy rises, reliance on ICTs has transformed traditional communication methods, enabling faster and more efficient exchanges of information. From mobile phones and social media platforms to the internet and community broadcasting, these technologies have become integral to everyday life, influencing sectors such as education, healthcare, and business.

The findings presented in this chapter highlight disparities in ICT access and use across different demographics, including age, gender, and geographic location. By exploring these patterns, we aim to identify barriers that some populations face in accessing information and to recognize the opportunities that ICTs provide for enhanced communication.

Ultimately, this chapter aims to provide a comprehensive overview of the current state of ICT utilization, emphasizing its significance in promoting inclusivity and supporting sustainable development. Through this analysis, we hope to inform policymakers, educators, and community leaders about the critical role of ICTs in bridging information gaps across diverse populations.

This section focuses on the population aged 10 years and above comprising approximately 55 percent of the female respondents and 45 percent of the male respondents (Table 5.1).

5.1 MOBILE PHONE OWNERSHIP

Phone ownership

Mobile Phone – A wireless handheld device that allows users to make calls and send text messages, among other features.

Eligibility: Household members aged 10 years and above.

The 2024 NPHC collected data on mobile phone ownership among household members aged 10 years and above, including the number of mobile phones each member possessed.

Table 5.2 shows that in 2024, there were approximately 13.6 million mobile phone owners in the country, representing 43 percent of the population aged 10 and above. Figure 5.2 shows that of the 13.6 million mobile phone owners, 37 percent own one phone, while six percent own two or more.

Patterns by background characteristics

The distribution of mobile phone ownership by residence indicates that ownership was higher in urban areas (46%) compared to rural areas (41%) (see Table 5.2).

The distribution of mobile phone ownership by sex indicates that in all sub-populations, a higher proportion of males owned mobile phones compared to females except in the Ankole subregion where more females owned mobile phones than males (see Tables 5.2 and 5.3).

Sub-regional variations reveal that Buganda had the highest proportion of mobile phone owners at 58%. In contrast, all other sub-regions had less than half of their population aged 10 years and above owning mobile phones, with the Karamoja sub-region reporting a notably low figure of 20 percent (refer to Figure 5.1).

Furthermore, the data shows that mobile phone ownership increases with education level, rising from about 27 percent among individuals with no education to 92 percent among those with post-secondary education.

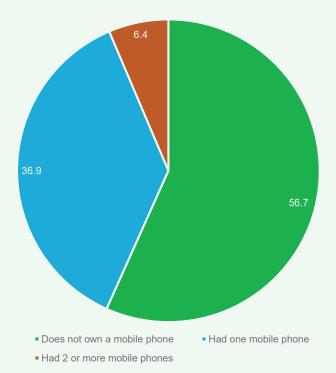

Additionally, mobile phone ownership follows a normal distribution by age group, with children and older persons exhibiting the lowest percentages at five percent and 43 percent, respectively.

Figure 5.1 Phone ownership

Figure 5.2 Phone ownership

Percentage distribution of the population aged 10 years and above by number of mobile phones owned

5.2 OWNERSHIP OF FIXED TELEPHONE LINES

Fixed phone ownership

A fixed phone, also known as a landline phone, is a traditional telephone that is connected to the public switched telephone network (PSTN) via a physical line, typically a copper or fiber optic cable. Unlike mobile phones, fixed phones are stationary and are usually installed in homes or offices.

Eligibility: Household

Fixed-line telephones continue to play a crucial role, especially in regions where mobile phone network access is limited or unavailable. According to Figure 5.3, only eight percent of households in Uganda had fixed telephone lines, with no significant difference observed between male and female household heads.

Patterns by background characteristics

Ownership of fixed telephone lines was slightly higher in urban areas (9%) compared to rural areas (8%). (see table 5.4)

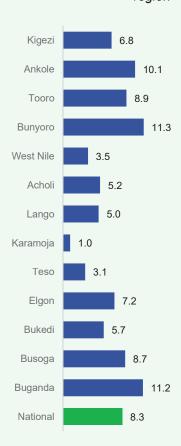

The percentage of households with fixed telephone lines showed minimal variation by sub-region, with the highest proportion in Bunyoro and Buganda (11% each) and the lowest in Karamoja (1%).

Disaggregation's by education level in table 5.4 reveal that ownership increases with the educational attainment of the household head. Specifically, the proportion of households owning a fixed phone rises from five percent among those with no education to 13 percent among those with post-secondary education.

Additionally, the proportion of households with fixed telephone lines increases with the age of the household head, peaking in the adult age category (9%) before declining to seven percent among the older persons.

Figure 5.3 Fixed Phone ownership

Household ownership of fixed telephone lines by subregion

5.3 OWNERSHIP OF COMPUTERS AND OTHER ICT DEVICES

Computers and Other ICT devices

In today's digital age, computers and other ICT devices play a pivotal role in enhancing communication, productivity, and access to information. From desktop computers and laptops to smartphones, tablets, and wearable technology, these devices enable individuals, households and organizations to connect, collaborate, and innovate like never before. ICT devices serve as valuable sources of information

The 2024 National Population and Housing Census (NPHC) collected data on various ICT devices owned by households, including mobile phones, fixed telephone lines, radios, televisions, and computers.

Eligibility: Household

Results in Figure 5.4 show that 76% of households had a member who owned a mobile phone, 41% owned a radio, 23% owned a television, eight percent owned fixed telephone lines, and four percent owned computers.

Patterns by background characteristics.

Sub-regional differentials in figure 5.5 reveal that Karamoja had the lowest proportion of households with a member owning a mobile phone, at 43 percent, while Buganda reported the highest proportion at 86 percent. Mobile phone ownership increased with the educational level of the household head, rising from approximately 52 percent among those with no education to 96 percent among households headed by individuals with postsecondary education

The proportion of households with a radio increased with the educational level of the household head, from 29 percent among those with no education to 54 percent among those headed by individuals with postsecondary education.

Sub-regional variations show that Buganda (7%) had the highest proportion of computer owners, while Bukedi, Bunyoro and Karamoja had the least (less than 2%). Computer ownership was closely linked to the education level of the household head, increasing sharply from one percent among those with no education to 21 percent among those with postsecondary education.

Figure 5.4: Ownership of ICT devices
Percentage of households who own ICT devices

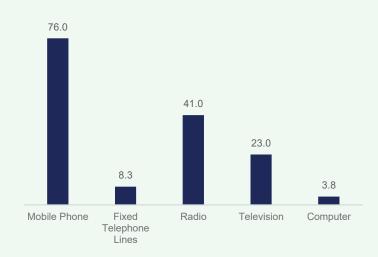

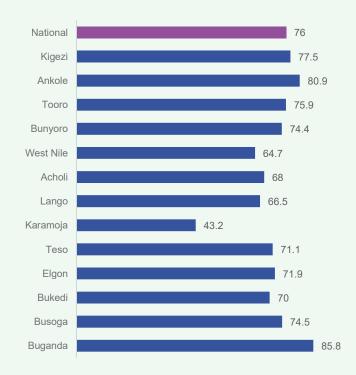

Figure 5.5: Ownership of Mobile phones

subregion

5.4 INTERNET USE

Internet

The internet is a global network of interconnected computer systems that utilize the Internet Protocol Suite to connect devices worldwide. It enables computers to communicate with one another through dedicated routers and servers. Additionally, users can access a wide range of information—including text, graphics, voice, video, and software—via mobile phones (World Telecommunication/ICT Policy 2013).

Table 5.7 shows that in 2024, nine percent of individuals aged 10 years and above (approximately 2.8 million people) had access to internet facilities.

Patterns by background characteristics

Table 5.7 shows that internet use was significantly higher in urban areas (17%) compared to rural areas (4%).

There were notable differences in internet access by sex, as shown in Table 5.7, with 11% of males having access compared to 8% of females.

Disparities by subregion in figure 5.6 show that Buganda (19%) had the highest proportion of internet users while Karamoja had the lowest proportion of internet users (3%).

Purpose of internet use

Figure 5.7 shows that among individuals who used the internet, 67 percent utilized it for social networking, while 16 percent used it for academic purposes and 13 percent used it for business or office work. Only one percent used internet to access health-related information.

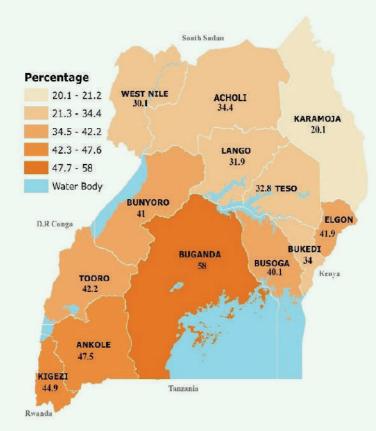

Figure 5.6 Purpose of internet use

Purpose of Internet usage for population aged 10 years and above

Figure 5.7 Phone ownership

Percentage distribution of the population aged 10 years and above who own mobile phones

5.5 SOURCE OF INFORMATION

Sources of information

Sources of information refer to the various channels through which households obtain knowledge and updates about their environment and community.

The main source of information considered here is based on the household members' usage, rather than ownership of the medium. This means that if a household primarily relies on a particular source of information, it is included, even if no member owns that medium. Common sources of information include traditional media such as radio and television, word of mouth, phone calls, social media, internet searches, email, community meetings and local announcers.

Eligibility: Household.

Table 5.9 presents the main sources of information for households, categorized by the sex of the household head and residence. Thirty-eight percent of households identified radio as their primary source, followed by word of mouth at 22 percent, phone calls at 15 percent, and television at 14 percent. Collectively, these four channels account for approximately 89 percent of households, while other information sources each represent less than 10 percent of the total.

Patterns by background characteristics

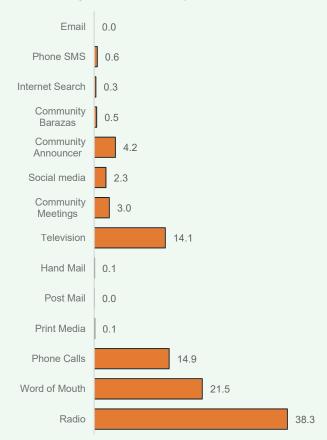

Disaggregation by the sex of the household head reveals that 41 percent of male-headed households and 33 percent of female-headed households relied on radio as their main source of information (refer to Table 5.9).

Word of mouth is more common among female household households (25%) compared to male headed households (20%), while phone calls show similar usage across both genders.

Other sources of information, such as television, community meetings and community announcers, account for a smaller percentage, with television usage accounting for 14 percent overall. Modern channels like social media and internet searches are used minimally (refer to figure 5.8)

Disaggregation by residence reveals that 42 percent of rural areas and 32 percent of urban areas relied on radio as their main source of information (refer to Table 5.9). Television use as source of information is higher in urban areas (26%) compared to rural areas (6%).

Figure 5.8 Distribution of households by main source of information Percentage of households by main source of information

5.6 ONLINE SERVICES

Online services

An online service refers to any information and services provided over the Internet for instance; passport, paying taxes, getting a permit, buying or selling goods/services online, internet banking among others.

Eligibility: Household members aged 10 years and above.

The use of online services in Uganda, including government services, e-commerce, online advertising, and internet banking, aligns national frameworks like NDP III, which enhance efforts to achieve Sustainable Development Goals (SDGs). It supports the National Development Plan (NDPIII) by improving public service efficiency, drives economic growth which is in line with Vision 2040, and furthers the Digital Uganda Vision by leveraging technology for better service delivery. Additionally, the 2014 National Information and Communications Technology (ICT) Policy promotes the use of digital tools to foster innovation and business growth. Together, these efforts contribute to creating a more inclusive and prosperous society. The 2024 NPHC collected data on online services used by household members aged 10 years and above.

Figure 5.9 shows that approximately two percent of individuals aged 10 years and above accessed online government services, while one percent used online shopping, internet banking and shopping/advertisements respectively.

Patterns by background characteristics

The distribution by sex of the household head indicates that in all sub-populations, a higher proportion of males use online services compared to the female counterparts (see Tables 5.8).

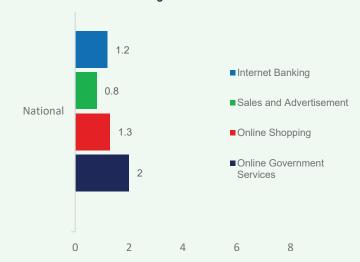

Sub-regional variations reveal that Buganda (4%) had the highest proportion who use online government services at four percent followed by Acholi, Ankole and Kigezi (2% each) and the rest of the sub-regions had less than two percent users.

Furthermore, government online services use increases with education level of the household head, rising from about one percent among individuals with no education to 14 percent among those with postsecondary education.

Disaggregation's by age group of the household head follow a normal distribution, with child headed households and households headed by older persons exhibiting the lowest percentage of online government service users.

Key Findings

- Ownership of a mosquito net: Eighty seven percent of households own at least one mosquito net.
- Health insurance coverage: Health insurance coverage was significantly low, with one percent of the population having access to insurance coverage

his chapter presents information on household ownership of mosquito nets, health outbreak awareness, access to health services in the community as well as access to health insurance.

6.1 Ownership of a mosquito net

Household ownership of mosquito nets is one of the central interventions for preventing malaria infection in Uganda. Each household in the NPHC 2024 was asked if they owned any mosquito net.

The results summarized in **Table 6.1** show that Eighty-seven percent of the households owned at least one mosquito net. There is sub-regional variation in household ownership of mosquito nets; Teso sub-region had the highest proportion of households with at least one mosquito net (93.4%) while Karamoja sub-region had the least proportion of households owning mosquito nets (83.3%). Table 6.7 shows that 85 percent of the mosquito nets were obtained from government mass distribution, while 14 percent were purchased, and 3 percent were obtained from NGOs by households.

6.2 Health Insurance

Health insurance policy is an agreement between the insured and the insurance company in which the insurance company agrees to cover the cost of certain listed medical benefits such as tests, drugs and treatment services. The NPHC 2024 collected information on whether household members were covered by any health insurance policy. The results in **Table 6.2** show that Uganda's health insurance coverage is low, with only one percent of the population having access to health insurance cover. The results also reveal minimal gender disparities between males and females. Regional variations also exist as shown in **Figure 6.1** with Kigezi leading at 2.9%, followed by Buganda sub-region (1.7%), and Bukedi sub-region lagging at 0.4%.

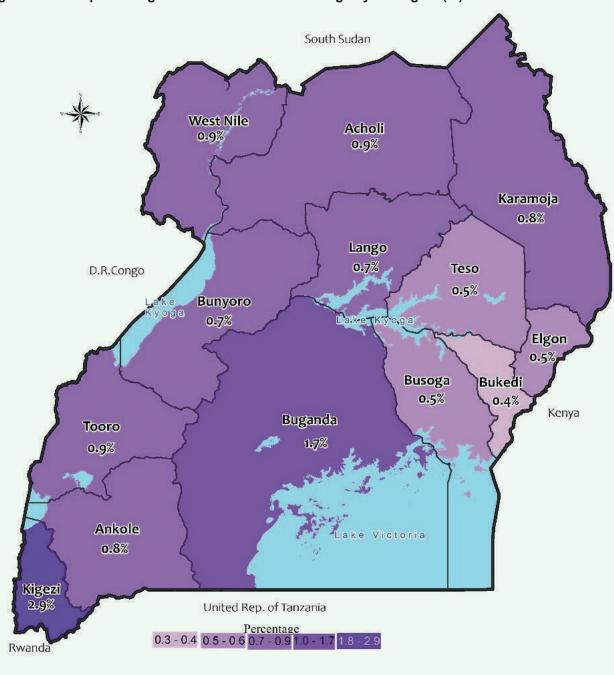

Figure 6.1: A map showing the health insurance coverage by subregion (%)

6.2 Health outbreaks

A health outbreak is a sudden occurrence of a disease or health condition in a specific geographic area population or community that exceeds the expected number of cases. An outbreak may affect a small group of people within a community or thousands of people across the entire community and beyond. In some instances, an outbreak may not be easily or quickly identified until it has affected so many people causing immense effects like death on the populace at large. Respondents to the NPHC 2024 household questionnaire were asked to give their perceptions on what signifies an outbreak.

A series of responses were obtained and have been highlighted in **Figure 6.2.** A significant proportion of the respondents (36%) reported that they can identify an outbreak if 5 or more people in the same household suffered the condition. Generally, every one in three respondents indicated that it was possible to identify an outbreak if occurrence of severe symptoms occurred.

Fever of 5 or more people in the same 36 household or nearby households Vomiting, diarrhea or abdominal pain of 3 or more people from separate households in a 24-33 Very sick person with bleeding from any body 32 part Sore throat, running nose or cough of 3 or more 32 people within 48 hours in separate households Sudden Death of 3 or more within 7 days in the 32 same community 5 10 15 20 25 30 35 40 45 50

Figure 6.2: Percentage distribution of respondent's perception on what signifies an outbreak.

6.4 Health services

In Uganda, the health system is composed of several players including government, private providers, traditional and complementary health practitioners. The Government of Uganda, through the Ministry of Health, aims to provide accessible and quality health care to the entire population.

Pursuant to the Uganda Vision 2040, the health sector aims at ensuring that Uganda's population is productive and can effectively contribute to socioeconomic growth. This makes the establishment of health facilities at the lower community levels important. Human capital development as prioritized in the NDP III is achieved by improving the quality of health service delivery, and efficiency of Primary Health Care, (NPA, 2020)

Availability of Health Centres and Hospitals in the Community

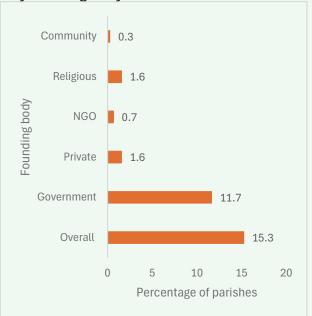

Percentage of Parishes with at least one Health Centre II

Population: Total number of Sub-counties

Background characteristics: Sub-region Residence

Figure 6.3: shows that 77 percent of the parishes in the country had at least one government founded Health Centre II. Privately owned health centre IIs were in about 11 percent of the parishes and those founded by the communities were in only 2 percent of the parishes. Overall, about 16 percent of the parishes had at least one Health Centre II, irrespective of the founding body.

Fig 6.3: Percent of Parishes with at least one HC II by founding body

Patterns by background characteristics

As shown in **Figure 6.4**, Kigezi Sub-region had the highest percentage of parishes with at least one Health Centre II (35%). This was followed by Busoga (24%) and Buganda (23%). Elgon sub-region had the lowest percentage (6%) of parishes with at least one Health Centre II.

Fig 6.4: Parishes with at least one HC II at Sub region level (%)

Availability of Health Centre III

Percentage of Sub-counties with at least one Health Centre III

Population: Total number of Sub-counties **Background characteristics:** Sub-region

Figure 6.5 shows that 87 percent of the Sub-counties in the country had at least one government founded Health Centre III. Private and NGO founded Health Centre IIIs were in 13 percent and five percent of the Sub-counties. The religious health centre IIIs were in 12 percent of the sub-counties. Community founded Health Centre IIIs were found in the smallest percentage of the Sub-counties (only 1%). Overall, 54 percent of the Sub-counties had at least one Health Centre III.

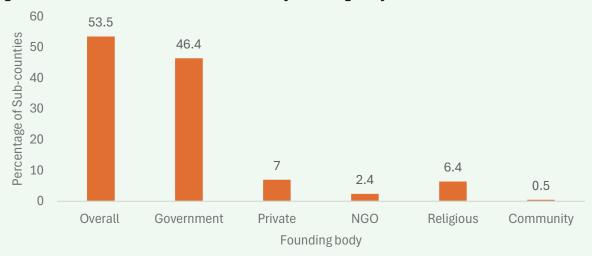

Fig 6.5: Sub-counties with at least one HC III by founding body

Patterns by background characteristics

As shown in **Figure 6.6**, Buganda Sub-region had the highest percentage of Sub-counties with at least one Health Centre III (65%). This was followed by Ankole (62%), Lango (61%) and West Nile (60%). Karamoja sub-region had the lowest percentage (30%) of Sub-counties with at least one Health Centre III.

Fig 6.6: Sub-Counties with at least one HC III at Sub-Region (%) level

Availability of Hospital

Percentage of Districts and Cities with at least one Hospital

Population: Total number of Districts & Cities **Background characteristics:** Sub-region

Figure 6.7 shows that 92 percent of the districts and cities in the country had at least one government founded hospital. Also, 68% of the districts had at least one private hospital. Only 15 percent of the districts and cities in Uganda had an NGO founded hospital. Overall, 95 percent of the districts and cities had at least one hospital, irrespective of the founding body.

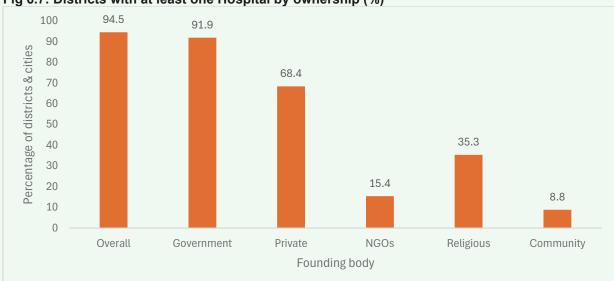

Fig 6.7: Districts with at least one Hospital by ownership (%)

Patterns by Background Characteristics

As shown in **Figure 6.8**, all the districts & cities (100%) in the Sub-regions of Busoga, Bukedi, Elgon, Lango, Acholi, Rwenzori and Ankole had at least one hospital. At least 90 percent of all the districts and cities in Buganda and West Nile Sub-regions had a hospital while it was the case of only 82 percent of those in the Karamoja sub-region.

Fig 6.8: Districts with at least one Hospital at subregion (%)

FERTILITY

Key Findings

- **Total Fertility Rate:** The total fertility rate is 4.5 children per woman, which is a decline from 5.8 children in 2014.
- **Crude Birth Rate:** The crude birth rate was 33.2 births per 1,000 population.
- Adolescent Childbearing: 6.5 percent of adolescent girls age 10-19, had begun childbearing. Five percent had a live birth and 1.5 percent were pregnant with the first child.

Fertility is one of the three components of population dynamics (the others being mortality and migration) and is essential for any study on the population. For countries lacking timely and realiable system of vital statistics, fertility data provides an opportunity for estimating vital rates that would otherwise not be available. Fertility levels determine the age structure of a population which, in turn, governs the social, economic and demographic characteristics of the population. There are several indicators used to measure current fertility. Recent and lifetime fertility are the main indicators used to estimate fertility rates from Census data. The reliability and robustness of fertility estimates from census data are thus dependent on the quality of the reporting of these indicators.

The 2024 Census asked questions about the number of children ever born to women aged 10 - 59 years. In order to reduce the error of omission of children not living with their mothers, the children were categorized by sex and into total children ever born, children alive and children dead. In addition, every woman who had ever had a birth, information was sought on the date of the last birth, the sex of last child and its survival status.

During Census such information is obtained using proxy response except for those women who were household heads. The census does not include questions on birth history of the children born. The data collected included children everborn, date of last child born alive, age of mother at first birth, Maritial status, age of mother and pregnancy status to improve fertility estimates based on children everborn. This data is, therefore, more likely to be affected by some errors due to recall lapse. Moreover, there is a tendency for women to under report their births, including misunderstanding of the reference period, under reporting of dead births and deliberate under reporting of births which all lead to the under estimation of fertility.

7.1 Life time fertility

Parity:

Number of children previously born alive to a woman of reproductive age.

• Computed from the total number of children ever born to a woman.

Life time fertility can be analyzed using a woman's parity. The results show that among the adolescents aged 15- 19 years, 10 percent had already had a child with nearly 2 percent having had 2 or more children. About 21 percent of the women in the 45–49 age group were childless and 25 percent had had 8 children or more (Table 7.1)

7.2 Current Fertility

Fertility analysis is important in understanding past, current and future trends of population size, structure and growth. Information on fertility levels, patterns and trends experienced by a country is important for socio-economic planning, monitoring and evaluating programmes. To formulate or evaluate policies concerning population growth, information is needed not only about the number of births but also on trends of birth rates and other measures of fertility over time. Current fertility can be measured using the Age-Specific Fertility Rate (ASFR), the Total Fertility Rate (TFR), the General Fertility Rate (GFR), and the Crude Birth Rate (CBR). The ASFR provides the age pattern of fertility and the TFR is the number of live births (children) a woman will have born at the end of her reproductive life if she experiences the current age pattern of child bearing.

7.2.1 Measures of Current Fertility

Current fertility was estimated using the Brass P/F Ratio indirect estimation method, which uses data on the number of births and children born to woman alive in the year preceding the census date.

7.3 Crude Birth Rate

The Crude Birth Rate (CBR) is defined as the number of births that occur in a particular year per 1,000 people. There were 1.5 million children born to all women (10-59 years) in the twelve months prior to the census date. This gives a CBR of 33.2 births per 1,000 population. The CBR for Uganda declined from 50.4 births in 1969 to 33.2 births in 2024 per 1,000 population (**Figure 7.1**).

Figure: 7.1: Crude birth Rate by Census years

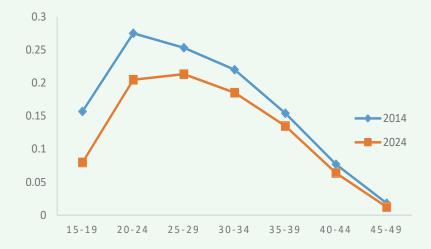

7.4 Fertility Levels and Patterns

The Total Fertility Rate (TFR) in Uganda is 4.5 children per woman implying that a woman in Uganda who is at the beginning of her childbearing years would expect to give birth to an average of about five children (4.5 children per woman) by the end of her reproductive period if age specific fertility levels remained the same. The general fertility rate shows that there were 129 births for every 1,000 women in the reproductive age group (15-49 years). **(Table 7.3).**

hildbearing starts early with women aged 15-19 years old. It also peaks early at 20-24 years age group and then declines thereafter. The same trend was observed for the 2014 Census. A sharp decline in ASFRs is witnessed between 35-39 and 40-44 age groups (Figure 7.2)

Figure: 7.2: Age Specific Fertility Rate by Census years

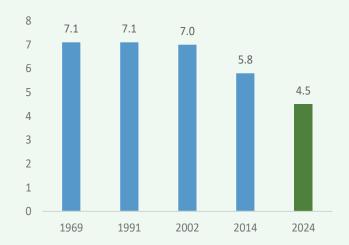

7.5 Fertility Trends

Total Fertility Rate:

This is the average number of children who would be borne to a woman in a given time period if she survives to the end of her reproductive lifespan (15-49) and experiences the given Age Specific Fertility Rates (ASFRs).

The Total Fertility Rate (TFR) is 4.5 births per woman showing a drop from 5.8 births per woman in 2014 Census after stagnating at that level from 1969 to 2002. **(Figure 7.3)**

Figure 7.3: Total Fertility Rates, 1969-2024

7.6 Fertility Regional Differentials

Fertility is known to vary by residence, educational background, and other background characteristics of a woman. Overall, Teso region has the highest total fertility rate of 5.5 and Buganda having the lowest total fertility rate of 3.8 (Figure 7.4). There was an observed decline in fertility by background characteristics between 2014 and 2024. The decline is more noticeable in the karamoja region that had a reduction by 3 children per woman of reproductive age 15-49 years (Table 7.4)

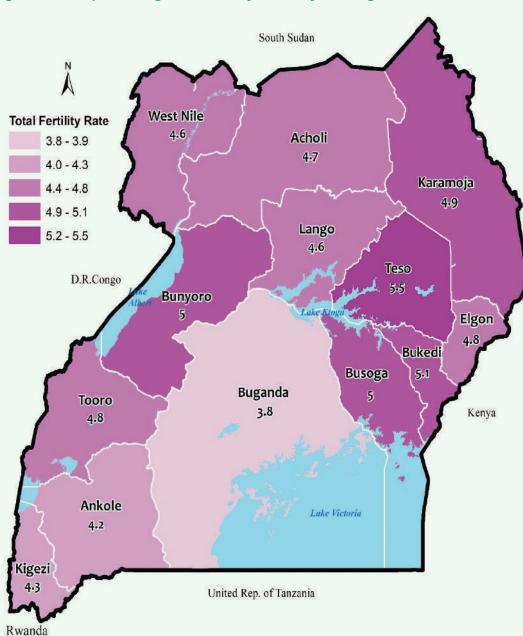

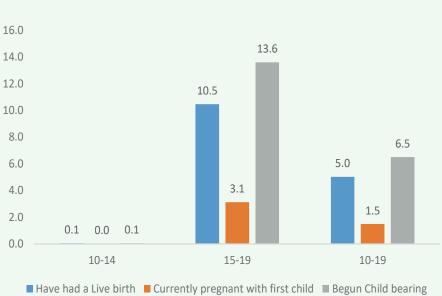

Figure 7.4: Map showing Total Fertility Rates by Sub regions

7.9 Adolescent Child Bearing

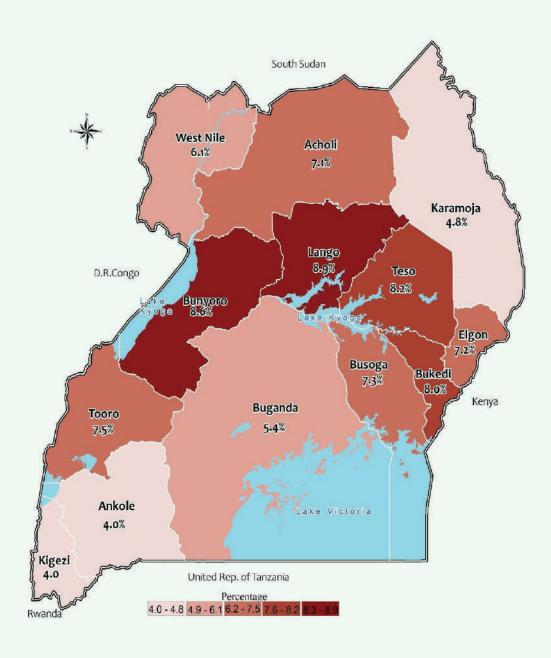

Adolescent girls are generally vulnerable to face pregnancy and delivery health problems as their bodies may not be physically ready. Seven percent of adolescent girls begun child bearing. Five percent have had a live birth and 2 percent are currently pregnant with the first child. (Figure 7.5)

Figure 7.5: Percentage of adolescents (10-19 years) who began child bearing

Bunyoro and Lango subregion (9%) had the highest percentage of adolescent girls age 10-19 who begun child bearing. This was low in Kigezi and Ankole region (4.0%) (Figure 7.6)

Figure 7.6: A map showing percentage of adolescents (10-19 years) who began child bearing by sub region

MORTALITY

• **Infant mortality:** For every 1,000 children born alive, 34 die before they celebrate their 1st birthday.

- Under-5 mortality: The Under-5 mortality for the 12-month period before the 2024 NPHC is 46 deaths per 1,000 live births.
- Life expectancy at birth-Total: The overall life expectancy at birth is 68.2(sixty eight years and 73 days).
- **Life expectancy at birth-Male:** The life expectancy at birth for males is 66.9 years.
- **Life expectancy at birth-Female:** The life expectancy at birth for females is 70.1 years.
- **Pregnancy-related mortality ratio:** The pregnancy-related mortality ratio estimate for the last 12-months is 233 female deaths per 100,000 live births.
- Maternal mortality ratio: The maternal mortality ratio for the 12-month period before the 2024 NPHC is estimated at 207 maternal deaths per 100,000 live births.

ortality is the incidence of death in a country's population. Infant and childhood mortality is highly sensitive to the socio-economic changes in the country. Therefore, studying levels of mortality provides an indirect measure of the welfare of a given population. The 2024 National Population and Housing Census (NPHC) collected information that used to compute mortality levels and these included deaths in the households, survival of parents, children ever borne and children survival, births and survival of those births in the last 12 months.

8.0 Estimation Procedure

To estimate child mortality, data on Children Everborne (CEB) and children Dead (CD) was used to generate proportions dead by age of mother. These were then converted into probabilities of dying by age. For adult mortality, data collected from recent deaths in the household (deaths that occurred in the household, twelve months prior to the Census) was used. Early experiences revealed that there is underreporting of deaths. The reported deaths was therefore adjusted basing on the level of completeness using the Brass growth balance method. The analysis involved the linkage of child and adult mortality to construct the life tables. The completeness of death reporting was estimated at 53 percent for females and 83 percent for males using the Brass growth balance method.

8.1 Crude Death Rates

The Crude Death Rate (CDR) is the number of deaths per 1,000 population in a given period, usually a year. In total, 212,393 deaths occurred during the 12 months preceding the census night, resulting in a Crude Death Rate (CDR) of 4.6 deaths per 1,000 persons.

8.2 Childhood Mortality

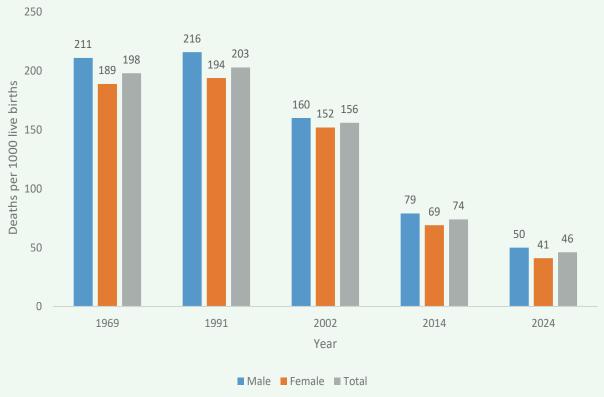

Child mortality is a core indicator for child health and well-being. Target 3 of the Sustainable Development Goal (SDG) Number 3 renewed commitment to the world's children: "By 2030, end preventable deaths of new-born babies and children under five years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 deaths per 1,000 live births and under-five mortality to as low as 25 deaths per 1,000 live births". Infant Mortality Rate (IMR) is the probability that a newly born child will not survive to the first birthday, while the Under-five Mortality Rate is the probability that a child born will not survive to the fifth birthday.

Figure 8.1 shows that the probability of dying before the first birthday (IMR) in 2024 was 34 deaths per 1,000 live births. The IMR among males was higher compared to that of females comprising of 37 deaths per 1000 births and 30 deaths per 1,000 births respectively. Figure 8.2 shows the probability of dying before the fifth birthday (Under Five mortality). Overall the Under-five mortality rate was 46 deaths per 1,000 live births of which males had a higher rate of 50 deaths per 1,000 live births. Childhood mortality is highest among the male infants. Figure 8.2 also shows a decline in IMR and Under Five Mortality rates dropping from 122 deaths per 1000 irths in 1991 to 34 deaths per 1000 births in 2024. On the other hand, the Under five mortality rate reduced from 203 deaths per 1,000 live births in 1991 to 46 deaths per 1,000 live births in 2024.

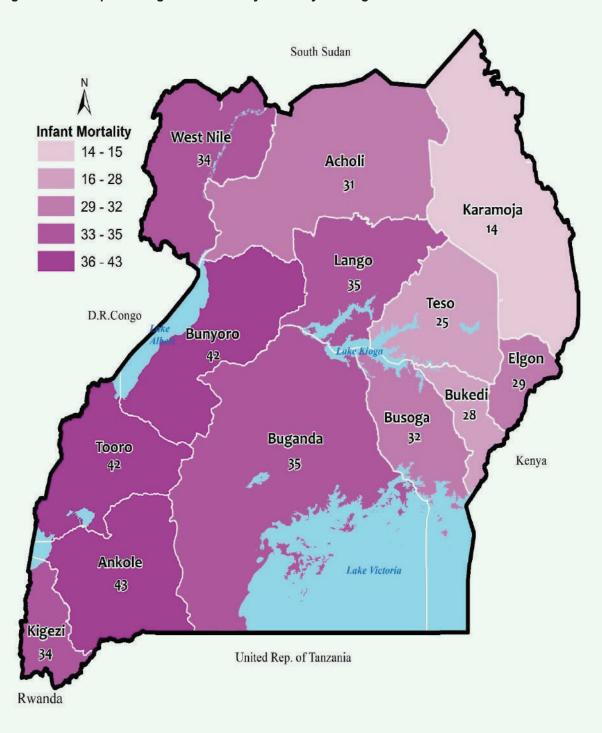

Figure 8.1: Infant mortality by census years

At sub regional level, Table 8.2 shows that the infant mortality rate was highest in Ankole (43.1 deaths per 1,000 live births) and it was lowest in Karamoja (13.6 deaths per 1,000 live births). A similar pattern is observed for under five mortality. The Under-five mortality rate was highest in was highest in Ankole sub eregion (62 deaths per 1,000 births) and lowest in Karamoja (18 deaths per 1,000 births).

Figure 8.3: A map showing Infant Mortality Rates by sub region.

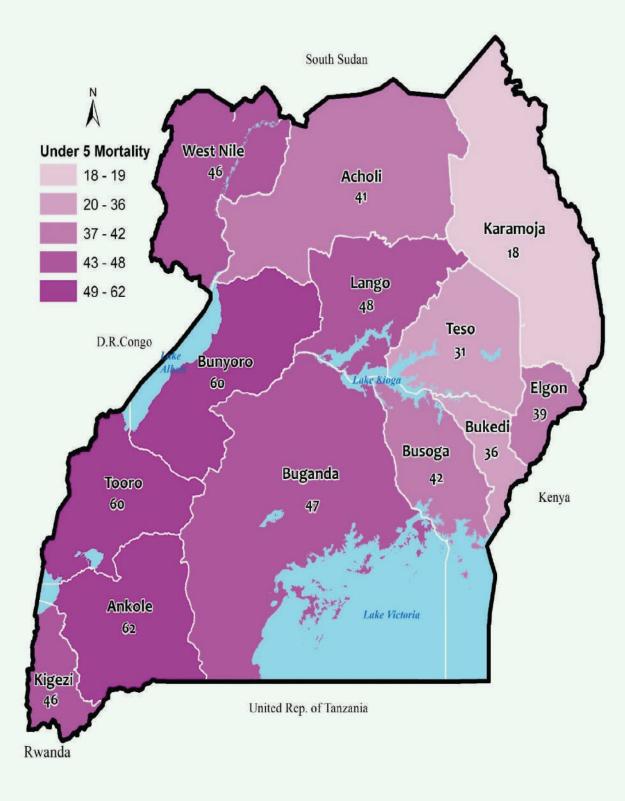

Figure 8.4: A map showing Under five Mortality Rates by sub region.

8.3 Life expectancy at birth

Life expectancy at birth is the average number of years that a new-born is expected to live if the current mortality rates continue to apply.

Life Expectancy at birth is a measure that is often used to gauge the overall health and wellbeing of a nation. It gives a summary measure of the mortality experience of the population at all ages. A life table consists of data on survivorship and the probability of dying of individuals within a given population. An increase in life expectancy could be attributed to improvements in healthcare. Figure 8.5 shows that, the overall life expectancy at birth in 2024 was 68.2 years. The life expectancy at birth for males (66.9 years) was lower compared to their female counterpants (70.1 years). This means that males and females born in Uganda now and subjected to the current levels of mortality at the different ages would expect to live for 66.9 years and 70.1 years respectively.

Between 2014 and 2024, males and females gained more 4 years and 6 years in their life expectancy at birth repectivel. This could be attributed to improvement in childhood mortality rates as they core in determining the life expectancies at birth. Figure 8.6 shows variation of life expectancy by sub region. Teso has the highest life expectancy of 78 years and Ankole has the lowest life expectancy at birth of 60 years.

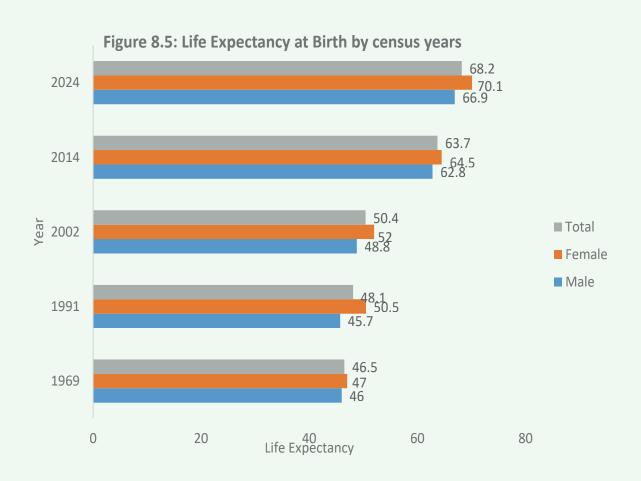

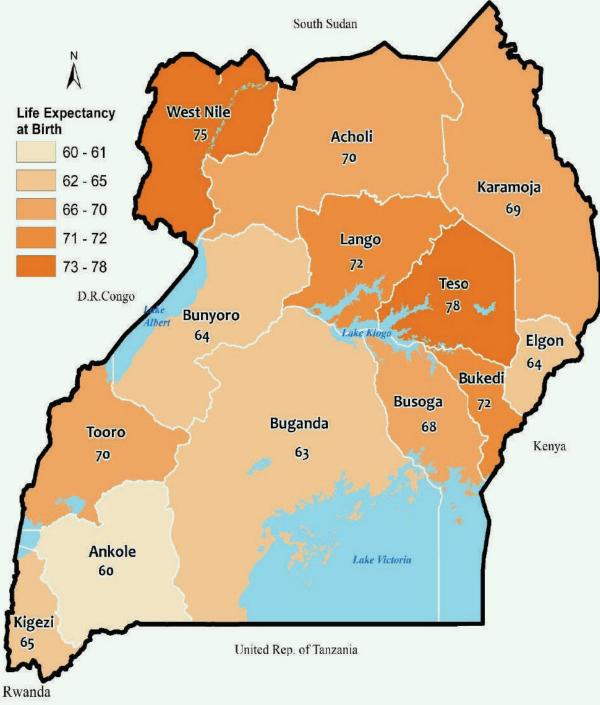

Figure 8.6: A map showing life expectancy at birth by sub region.

8.4 Maternal mortality

Information on maternal mortality was collected from women age 10-59 years but the anlysis only focuses on women in the reproductive age group (15-49). Questions on mortality refered to deaths that had occurred in the household within the last 12 months and whether the deceased was pregnant at the time of death, died during child birth or within six weeks after child birth. Incase the deceased was a female, the respondent was asked whether she died while pregnant at the time of death, while giving birth or died within 6 weeks after delivery. In total 88,408 women died 12 months before the Census and 3,867 were maternal deaths reported regardles of cause of which 3, 441 deaths not due to accident or violence. The reported births were about 1.5 million that was adjusted to about 1.7 births.

The Maternal Mortality Ratio (MMR) refers to maternal deaths per 100,000 live births excluding those that occurred due to "accident" and "violence". The Pregnancy Related Mortality Ratio (PRMR) includes all maternal deaths regardless of cause. Tables 8.7 and 8.8 shows a PRMR of 233 deaths per 100,000 live births and the MMR of 207 deaths per 100,000 live births.

The lifetime risk (LTR) of maternal death reflects the chances of a woman dying from maternal causes over the course of her 35-year reproductive lifespan. This indicator takes into account the probability of a death occurring due to maternal causes each time a woman becomes pregnant. The overall life time risk of maternal death was therefore calculated by multiplying the maternal mortality rate by 35. The overall LTR for PRMR was about 12 and that of MMR was about 10.

8.3 Place of Death (health facility or non-health facility)

Understanding patterns of mortality and place of death, the location or setting is important to help provide appropriate services and resources for primary health care especially end-of-life care. When the death occurs in the health facility, it is easier to manage and administer the deceased's medical certification for cause of death than when it occurs outside the health facility.

The country has made some progress in the registration of deaths, where the Ministry of Health in conjunction with National Identification and Registration Authority (NIRA) and other key stakeholders have spearheaded registration of health facility and community deaths. The goal of this analysis is to measure the percentage of deaths that occur in the health facilities to guide the programming for certification for cause of death. The 2024 NPHC included a question on whether the death was registered, the place of death, for those households that reported a death in the 12 months prior to the census, to ascertain whether it occurred in a health facility, at home, on the way to hospital, among others.

Table 8.9 shows that, overall, 49 percent of the deaths occurred in the health facility. Spatial differentials by sub region shows that Acholi subregion (55 percent) followed by West Nile subregion (53 percent) had the highest percent distribution of deaths that occurred in the health facility, while Karamoja subregion had the lowest (37 percent).

LIST OF TABLES

MIGRATION AND FORCED DISPLACEMENTS

Key Findings

- Nationality: At the time of the NPHC 2024 to 98% of the total household population were of Ugandan nationality (Ugandans). The non-Ugandans constituted about two percent and the stateless persons, less than one percent
- *Number of migrants*: The total number of migrants preceding the census night were 13 million persons which accounts for about 30 percent of the total household population.
- Recent migration in the last five years: 45 percent of the total migrations prior to the census night occurred withing the five years before the census
- *Immigrants*: Nationally, there were about 1 million immigrants by the census night and of these, 97 percent were previously residents in East African countries. 47 % of these moved due to security related reasons.
- *Emigrants:* 51% of the total emigrants left for Asia as their first destination, and 27% of emigrants from Uganda left to east African countries as place of first destination. 82% of the total emigrants moved for job related reasons
- Refugees/Asylum seeker: The displace/refugees in the country were 805,589 persons which accounted for about two percent of the total population in the country

igration statistics refer to the general indicators on the size, composition, and characteristics of a migrant population. Migration is one of the components of population change and it has social and economic implications to a country. The study of migration is gaining importance globally due to its nature, causes, consequences and diverse demographic trends and patterns among/between countries, which are a key in policy formulation and implementation. The 2030 Agenda for Sustainable Development recognizes migration as a driver of sustainable development, for both the migrants and their communities. Therefore, if migration is poorly managed, it can negatively impact on development.

"Uganda is currently the third biggest refugee hosting country worldwide and largest in Africa". Therefore, statistics on migration and displaced persons in Uganda will provide an evidence base for policy makers, enable the development of a comprehensive national policy on migration, and inform a unified approach to the management of migration issues; thereby creating a protective environment for vulnerable migrants, enhancing refugee protection and migration management.¹

¹ National Planning Authority. The Third National Development Plan 2020/21 – 2024/25

Migration is the movement of people from one place to another with an aim of establishing a permanent residence. It includes movement of persons from one place to another, either willfully or being forcefully displaced due to various reasons that may be natural or human conflicts. Forced displacement results into refugees, asylum seekers and internally displaced persons.

This chapter presents the patterns, volume and differentials of migration in Uganda. The NPHC 2024 collected data on various variables to be used in the estimation of migration levels in the country. These included: place of birth, previous residence, reason for movement, duration of stay in the district at the time enumeration for all household members. There were questions to determine if one was a refugee/asylum seeker and their registration status.

A person whose place of residence at the census date, was differed from his/her previous residence was taken as a migrant. Although data was gathered about the district of previous residence, this report will not provide inter-district migration patterns. The lowest unit of presentation on internal migration in the country is the sub-region.

9.1 NATIONALITY OF THE POPULATION

In the compilation of migration statistics, determining the nationality is important in the governance of the different categories of people in line with the freedoms, protection and other rights they are entitled to.

Nationality is the status of a person that is recognized by law as being a member of a particular nation by origin, birth or naturalization. It is used to identify the population that is eligible for certain public services such as employment, education and health services

Whereas some people acquire the nationality by their place of birth, parentage or a long-term residence in a country, some are born stateless, while others become stateless. Statelessness can result from a variety of factors such as discrimination against minority groups, gaps in nationality laws, creation of new countries, lack of birth registration and denationalization.

During the NPHC 2024, the nationality status of all the persons who were enumerated was determined and the results are presented in Table 9.1. The nationality status of the population was categorized into three: Ugandans, non-Ugandans and stateless persons. The category of Ugandans refers to those persons with Ugandan nationality while the non-Ugandans are those that do not have Ugandan nationality. Stateless persons are those who are not recognized as citizens or nationals under the laws of any country and, consequently, cannot enjoy the rights that are associated with citizenship (UNHCR). In Uganda, there are currently four (4) tribes which constitute the stateless persons. These are the Benet, Maragoli, Bakingwe and Bagabu.

The results presented in Figure 9.1 show that at the time of the NPHC 2024, up to 98% of the total household population were of Ugandan nationality (Ugandans). The non-Ugandans constituted about two percent and the stateless persons, less than one percent. These results relate to the persons who were enumerated in the households; excluding the nationalities of persons who were in institutions and homeless.

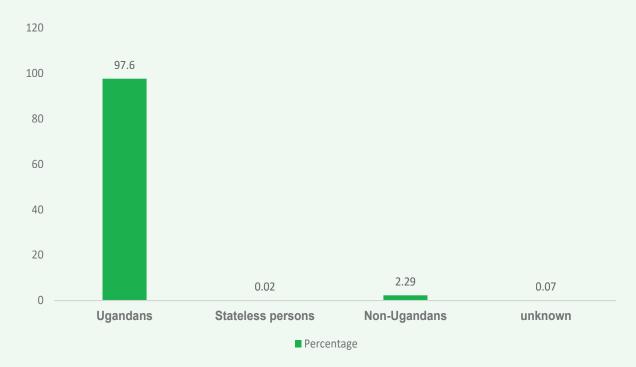

Figure 9.1: Proportion of the Household population, by Nationality

9.2 MIGRATION IN UGANDA

This section presents findings on the household population which made internal migration or came into the country. Also, for purposes of the NPHC 2024, a person was considered an internal migrant if they moved from one district to another stayed for at least six (6) months. It excludes the population which moved out of the country during the reference period (five year preceding the census).

9.2.1 Household Population by Migration Status

The results presented in Figure 9.2 shows that up to 70% of the household population had never moved from their usual places of residence while 30 percent moved. The results also show that more females migrated (32%) compared to the males (28%).

Figure 9.2: Household Population by Migration Status

The analysis of migration by special age group shows that the majority of migrants where the Adults (18 years and above) and Youths (18-30 years).

Buganda sub region had the highest percentage of migrants (40%) while Kigezi sub-region had the lowest (2%).

9.2.2 . Recent Migration

Recent migration refers to all movements that occurred five years prior to the census date. The results show that overall, the females (56%) migrated more than the males (44%). (Table 9.3)

Results in Figure 9.3 show that Buganda sub-region had the highest proportion of the total recent migrants (45%), while Kigezi sub-region had the least proportion (about two percent).

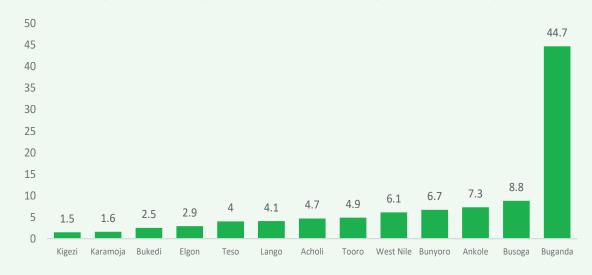

Fig. 9.3: Percentage Distribution of Recent Migrations, by Sub-region

Results in Figure 9.4 show that the working age, 14-64 years constituted the highest percentage (80%) of the total recent migrants. The older persons constituted the least percentage (two percent)

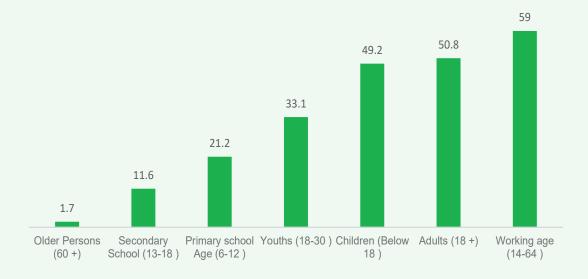

Fig. 9.4: Percentage of Recent Migrations, by Special Age Group

9.3 **Internal Migration**

Internal migration is the movement of people involving change in residence within national boundaries. For purposes of the census, an internal migrant is defined as a person who moved from one district (referred to as previous residence) to another (the current resident at the time of the census) with the intention to stay permanently.

9.3.1 **Migration Rates**

9.3.1.1 In and Out Migration rates

For the purpose of the NPHC 2024, the in-migration rate is the proportion of the migrants entering a specified district/region to the total internal migrant population. Also, the out-migration rate is the proportion of the migrants leaving a specified district/region to the total internal migrant population.

The results in Figure 9.5 indicate that Kigezi had the highest outmigration rate (26%), followed by Bukedi (19%) and Ankole (16%). Karamoja sub-region had the least out-migration rate (four percent).

Bunyoro sub-region had the highest in-migration rate (22%), followed by Buganda (15%). West Nile had the least in-migration rate (two percent). More information about regional migrations is in Table 9.4

26.3 25 21.6 19.1 20 15.3 15 11.9 10

■ Out Migration Rate

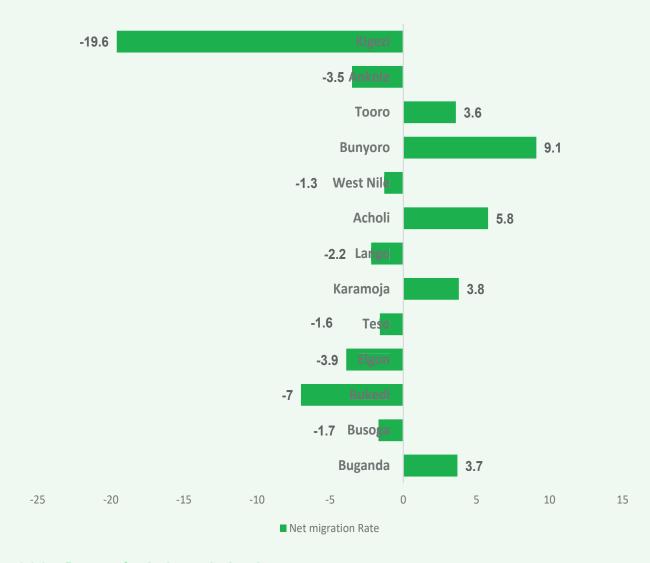

■ In Migration Rate

Figure 9.5 In and Out Migration Rates, by Sub-region

9.3.1.2 **Net Migration Rates**

Net Migration is difference between the in-migrants and the out-migrants. A negative Net Migration rate means that more persons left the district/sub-region; while a positive Net Migration rate means that more persons entered into the district/sub-region. Results presented in Figure 9.6 indicate that Kigezi sub-region had the highest negative net migration rate (-20), implying more people left the sub-region while Bunyoro sub-region had the highest positive net migration rate (9) implying that more people came to settle in the sub-region.

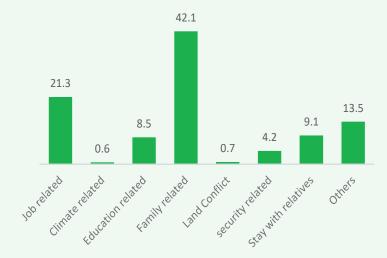

Figure 9.6: Net Migration Rates by Sub-region

9.3.2 Reasons for the internal migration

People migrate due to various push and pull factors in their current and previous residences. The results in figure 9.7 indicate that most migrants migrated due to family related reasons at (42%) followed by job related reasons (21%). Those that moved for land conflicts and climate related reasons were the least at one percent.

Figure 9.7: Reasons for migration

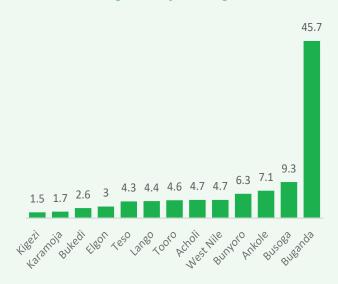

9.3.3 Recent Internal Migration

This section presents findings on the recent internal migration in Uganda. For the purposes of the NPHC 2024, recent internal migration refers to the movements that occurred between districts within a period of five years preceding the census, for permanent stay.

The results presented in Figure 9.6 show that overall, 46 percent of the total recent internal migrations in the five years preceding the census occurred in Buganda, followed by Busoga (9%). Kigezi and Karamoja sub-regions had the least internal migrations, both at less than two percent. (Table 9.6).

An analysis for the recent internal migrations was also done for persons 10 years and above. The results are presented in **Table 9.7**, by various background characteristics. According to the results, more than half (57%) of the recent internal migrants aged 10 years and above are married/living together.

Figure 9.6 Percentage Distribution of Recent Internal
Migrants, by Sub-region

Only nine percent of the recent internal migrants aged 10 years and above had post-secondary education. The results also show that 20 percent of the recent internal migrants aged 10 years and above were illiterate.

9.4 International Migration

International migration is the movement of people across international borders for the purpose of settlement. International migration includes both immigrants and emigrants. Data was collected on the country where the immigrants came from and where the emigrants moved to. During analysis, the previous and current locations were categorized by continent.

9.4.1 Immigration

Immigration refers to the movement of persons into a country, to stay permanently. Results show that there was a total of 1,022,577 immigrants as at the census night in May 2024.

Figure 9.7; 95 percent of the immigrants Country of Origin were from East Africa. This was followed by immigrants from other Asian countries, at two percent.

The immigrants from Europe, American other Africa countries and Oceania collectively constituted about one percent.

According to the results presented in Figure 9.7 Percentage Distribution of Immigrants, by

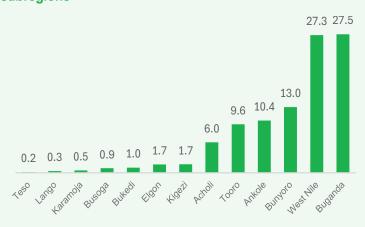

9.4.1.1 **Recent Immigration**

This section presents findings on the recent immigration in Uganda. For the purposes of the NPHC 2024, recent immigration refers to the movements that occurred across the borders into Uganda within a period of five years preceding the census, for permanent stay.

highest percentage of the recent immigrants were in Buganda (28%) and West Nile (27%) while Teso, Karamoja Lango and Busoga had the less than one percent.

More results on recent immigration are in Table 9.7 and these show that 51 percent of the recent immigrants had no formal education, Of those in the Marriage age group, about 49 percent were never married

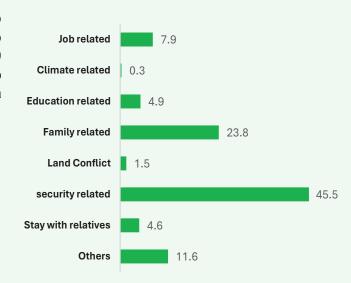

The results in Figure 9.8 indicate that the **Figure 9.8 Percentage Distribution of recent Immigrants**, by host subregions

9.4.1.2 Reasons for immigration into Uganda

Among the immigrants that came into the country, 46% migrated because of security related reasons, 7% migrated because of job related reasons, and 6% migrated due to education related reasons. Table 9.9 indicates that Of those who migrate due to security reasons, 97% were from east Africa and 2% were other Africans.

Figure 9.9 Main reasons for immigration into Uganda by country of origin

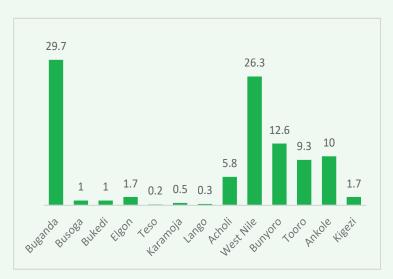

9.4.2 Returnee migrants

Return migrants are persons going from a host country back to a country of origin, country of nationality or habitual residence usually after spending a significant period of time in the host country whether voluntary or forced, assisted or spontaneous. In 2024 NPHC, individuals were asked whether they have ever lived outside Uganda since 2019. This question was analyzed based on the response to ascertain whether the person is a returnee migrant or not.

The results in Figure 9.10 indicate that most of the returnee migrants were enumerated from Buganda sub-region (30 percent) while Teso sub-region had the least proportion of returnee migrants (below one percent).

Findings in Table 9.10 show that of the total returnee migrants, 48 percent were currently married/living and 48 percent were never married.

Figure 9.10 Percentage Distribution of Returnee Migrants, by Sub-region

9.4.3 Emigrants

Emigration is the relocation or process of people leaving one country to reside in another. People emigrate for many reasons such as increasing one's chance of employment or improving quality of life. Emigration

affects the economies of the countries involved in both positive and negative ways, depending on the current state of the countries' economies.

9.4.3.1 Emigrants by Country of First Destination

The NPHC 2024 collected data on emigrants and their socio-economic characteristics. According to the results presented in Figure 9.11, up to 51 percent of the emigrants had countries in Asia as their first destination. This was followed by the countries in East Africa (27%). The countries in South America had the least emigrants (less than one percent). The Figure also shows that for the emigrants to the Asian countries, the females were more (63%) as compared to their male counterparts (30%)

Figure 9.11: Stock of nationals abroad by sex and country of destination

9.4.3.2 Main Reason for Emigration

The drivers for emigration are diverse and influenced by individual circumstances, economic conditions, and global trends. Understanding these reasons helps in addressing the needs and rights of migrants and formulating effective immigration policies.

The major reason for emigration was job related (82%). The proportion of migrants who left the country for education purposes was 7%. An analysis was done to determine the reasons for emigration by country of destination. Results show that the highest percentage of those who migrated to Asia were due to job related reasons (71%). (**Table 9.12**)

There was a notable difference between male and female emigrants in terms of their motivations: Seven-eight percent of the females emigrated for job-related reasons; compared to 85% for the males.

9.4.3.3 Emigration for Employment by Country of Destination

Emigration for employment varies widely by country of destination, influenced by factors such as economic opportunities, labor market demands, and immigration policies for example Saudi Arabia is undergoing economic diversification through Vision 2030, attracting foreign talent in areas like healthcare, technology, and engineering and the "Saudi Green Card" initiative aims to attract skilled expatriates. Individuals often move to countries with strong job markets and higher wages, countries with aging populations are attracting

healthcare workers. **Figure 9.11** shows that the majority of the emigrants 14-64 years who left for employment are in Asia (59%) followed by those who left for East African countries (23%). Other Africa accounted for about 6% of for employment emigrants while Europe accounted for 4% of these emigrants.

Figure 9.12: Stock of nationals abroad for employment by sex and country of destination

9.4.3.4 Emigrants by Sex and country of current residence

Understanding the demographics of emigrants by sex and their current residence provides insights into global migration trends and the labor market's demands

The results in **Table 9.13** provide insights into the distribution of emigrants based on their current residence, segmented by sex. The significantly higher number of female emigrants suggests a trend where women are more likely to relocate internationally compared to males. The majority of the male emigrants (41%) are currently residing in east Africa, while the majority of the females are currently in Asia (64%) (**Figure 9.13**). This suggests that Asia is a major destination for female emigrants, possibly due to employment opportunities in sectors such as domestic work, education and healthcare, which traditionally attract women.

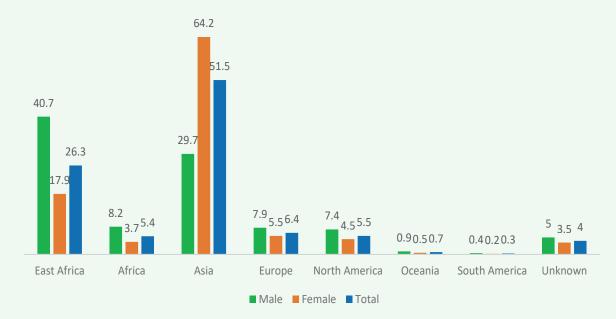

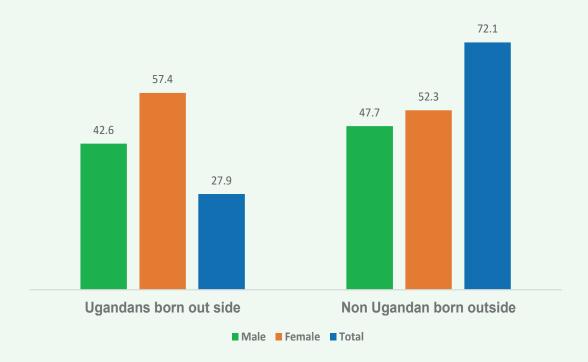

Figure 9.13 Nationals abroad by sex and current place of residence

9.5 Foreign born population

The foreign-born population covers all persons who have ever migrated from their country of birth to their current country of residence. These may include nationals of the host country. The results in Figure 9.14 indicate that 28% of the foreign-born population are Ugandans born outside of the country while 72 % are non-Ugandans born out of Uganda.

Figure 9.14 Percentage distribution of Foreign-born population by sex

9.6 REFUGEE CHARACTERISTICS

The 1951 convention defines a refugee as a person who has fled their home country due to a well-founded fear of persecution based on race, religion, nationality, membership to a certain social group or political opinion and is unable or unwilling to return to their country due to this fear. Being recognized as a refugee entitles a person to various rights including the principle of non-refoulement (not being returned to place where they could face such persecution), right to seek asylum, right to access to basic services like health care, education and proper sanitation and right to free movement.

Studying refugees is crucial as it helps comprehend complex global issues such as conflict, persecution and displacement. Learning about refugees raises awareness about humanitarian crises and the plight of vulnerable populations and the need for support and protection while understanding the economic and social impacts of large-scale migration on both the refugees and the host communities.

This chapter presents the patterns, volume and differentials of refugees in Uganda. The 2024 census gathered information about refugees /asylum seekers of all household members and their registration status since arriving in Uganda. This data was collected using local teams of refugee enumerators, who were familiar with the geography and language used by these refugees in both the communities and refugee settlement camps under the supervision of the Office of the Prime Minister (OPM). This information was used to assess the characteristics of refugees in the whole country. A person who declared that he/she was a refugee/ asylum seeker in a household was considered as so. This report provides information about refugees and asylum seekers for all those living in the gazetted refugee settlement camps and those residing in the host communities. Important to note is that the refugee population in Uganda consists of those who were immigrants into the country and also those who were born and raised in Uganda ie children born to refugees in Uganda were also considered as refugees.

9.6.1 The composition and distribution of refugees in Uganda.

Table 9.15 provides a detailed demographic breakdown of refugees in Uganda, focusing on age, sex, sub-regions, Literacy levels and registration status. Fifty-two percent of the total refugees in Uganda were females and 48% were males. The refugee population is mainly characterized by a relatively young population which means that there are high birth rates.

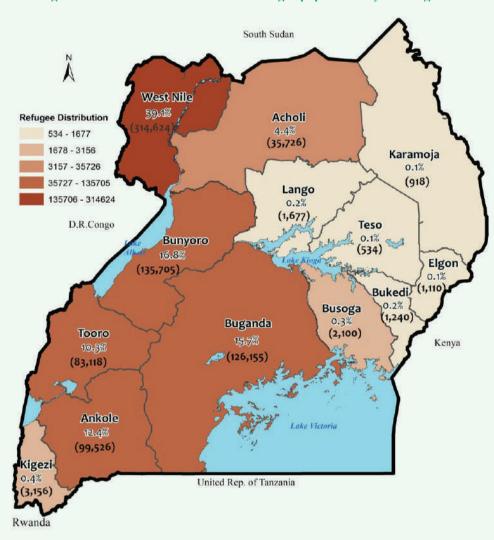

Figure 9.15: Distribution of the total refugee population by Sub-region

The highest percentage of refugees in Uganda were found in the West Nile sub region (40%), followed by Bunyoro subregion (17%) and Buganda subregion (17%). Karamoja, Teso and Elgon region had the lowest percentage distribution of refugees in the country (0.1%) (**Figure 9.15**).

9.6.2 Refugees by special age groups

The population of refugees under one year is relatively a small proportion showing 2% of the refugee population are under one year, this highlights the needs for healthcare and support for very young children. The children (< 5 years) constitute 14% the refugee population (14%), emphasizing the need for early childhood care and education program. the primary school going age (6-12 years) constitutes of significant part of the refugee population (22%), this represents nearly a quarter of the total population. Efforts should focus on ensuring access to primary education for both genders. The youth 18-30 age group were 24%. There was no sex variation in the percentage distribution of this age group. This emphasizes the need for youth programs that address education, vocational training, and empowerment. The category of older persons shows a decline in numbers, with older adults (60+) comprising a small percentage of the population (3%). The distribution indicates that while there are fewer older refugees, those that are present require targeted health and social support services, (Table 9.16).

9.6.3 Registration status of refugees/asylum seekers

It is through registration processes that UNHCR and its partners obtain a reliable, accurate and up-to-date account of the refugee and asylum seeker population: who they are, where they are and what their needs are. Registration provides the first formal opportunity to identify children, in particular unaccompanied or separated children, child-headed households or other boys and girls with specific vulnerabilities and needs.

Figure 9.12 shows that about 48% of the male refugee population were registered and only about 52% of the female refugee population were registered.

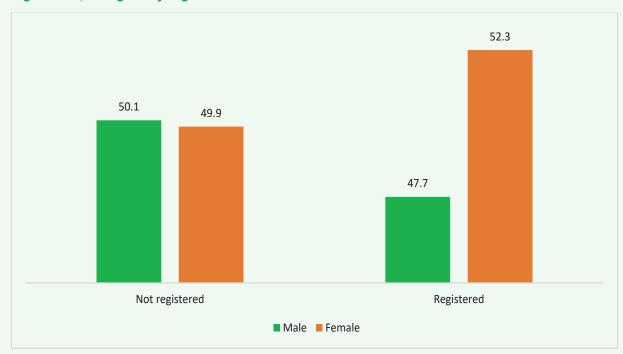

Figure 9.16; Refugees by registration status

The results in Table 9.17 provides valuable insights into sex distributions across different districts that host the refugee settlement camps in Uganda, highlighting both similarities and differences between urban and rural districts. The 'Others' aggregates all districts that do not have refugee resettlement camps but have people who reported as being refugees since their proportion is very small except Kampala that majorly hosts urban refugees. There was no major sex variation seen in Kampala, Arua and Lamwo (50:50). The table also shows that refugees distributed among other districts were about 17%, Isingiro district alone hosted about 12% of the total number of refugees. Adjumani district hosted about 11% of the total refugee population and Kampala as a major host for urban refugees at 11%. Among the districts with refugee settlement camps, Arua district hosted the least number of the refugees (0%).

LABOUR FORCE 10

Working Age Population: Nationally, approximately 25.2 million persons (56.7%) of the population was in the working age population

Employment to Population Ratio: EPR for Uganda in 2024 was 38 percent. The males in employment were higher than females (43%) and (33%) respectively.

Unemployment Rate: Overall, the unemployment rate was 12.6 percent in 2024. Unemployment rate was highest among females (15%) compared to males (11%).

Youth Unemployment Rate: Sixteen percent (16%) of the population aged 18-30 years were unemployed during 2024.

Labour Force Participation Rate: Overall, the LFPR was 43% with highest percentage among males (48%) and females (39%).

Youth Not in Employment, Education or Training (NEET): Fifty-one percent were neither employed, in education, nor in training, while 35 percent were no longer in school and were employed, and 12 percent were still attending school.

nformation from the 2024 National Population and Housing Census provides valuable data on the economic characteristics of the household population, offering essential context for interpreting labour market indicators.

Labour statistics are critical for measuring a nation's economic growth and development. They play a vital role in monitoring and evaluating national and international development frameworks, such as the National Development Plan (NDP) III, Africa Agenda 2063, and the 2030 Agenda for Sustainable Development Goals (SDGs), all aimed at improving the welfare and quality of life for Ugandans. To address the urgent need for poverty reduction and enhanced welfare, the Government of Uganda has prioritized investment and job creation, as reflected in the theme of the National Development Plan (NDP) III: "Sustainable Industrialization for Inclusive Growth, Employment, and Sustainable Wealth Creation."

The labour force is a key driver of any economy, representing the segment of the population that is actively engaged in or seeking employment. Economic characteristics related to the labour force provide insights into productivity, development potential, and structural challenges within the economy. This chapter presents essential labour market indicators, including the labour force participation rate, employment-to-population ratio, unemployment rate, potential labour force, and employment status, aligning with the definitions established by the 19th and 20th International Conference for Labour Statisticians (ICLS) of the International Labour Organization (ILO).

The economic characteristics chapter goes beyond labour market indicators to provide a broader perspective on household welfare. It includes sections on vital factors such as sources of livelihood, access to basic necessities like clothing and shoes, and the role of remittances in supporting households. This comprehensive approach enhances our

understanding of the economic dynamics at play, capturing both employment metrics and the various elements contributing to the financial stability of households across Uganda.

10.1 WORKING AGE POPULATION

Working Age Population

The National Employment Policy 2011 defines the working-age population as the population aged 14-64 years. It is a vital concept in labour statistics as all indicators in this chapter are derived from this group. The lower age limit is set taking into consideration the minimum age for employment and exceptions specified in the national laws or regulations, or the age of completion of compulsory schooling.

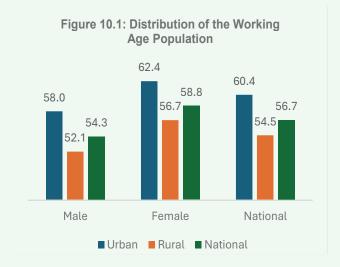

Data for compilation of labour market indicators was collected on all persons aged 14 years and above to allow for In-depth analysis of labour force characteristics of the WAP for Uganda (14-64 years) and international comparison of key labour market indicators (15+ years).

10.1.1 DISTRIBUTION OF THE WORKING AGE POPULATION

The findings revealed that 56.7 percent of Uganda's population falls within the working-age group with more females than males (**Table 10.1**).

Patterns by background characteristics

- Sex differentials show that there were more females (59%) than males (54%) in the working age group. (Figure 10.1).
- Findings also show that majority of the working age population had completed secondary level of education (98%) while about (30%) of the working population had no formal education
- Disaggregation by residence revealed that the highest population in the working age population were residing in the Urban areas (60.4%).

• Regional variations show that Karamoja sub-region had the least percentage of working age population (49%) while Buganda had the highest percentage of persons within the working age population (60%) followed by Ankole (60%). (Table 10.1)

10.2 EMPLOYMENT TO POPULATION RATIO

The Employment- to- Population Ratio (EPR) refers to the proportion of the Working Age Population that is in employment. This is the total number of employed persons expressed as a proportion of the working age population. The EPR, also known as the Employment Rate, provides a good indication of the degree to which the economy is utilizing its key productive labour resource.

The overall Employment-to-Population Ratio (EPR) in 2024 was 37.5 percent indicating that 3 of 10 persons aged 14-64 years were employed. The EPR was highest among males (43%) than females (33%). The Employment-to-Population Ratio (EPR) was higher among urban populations (42%) compared to those residing in rural areas (35%).

Patterns by background characteristics

Disaggregation of the employed population by education attainment showed that majority of employed persons were those with education attainment of postsecondary and above (68%) while those with no formal education were the lowest at 32 percent an indication that population in employment increases with increase in education attainment.

Sub-regional differentials show that Buganda and Kigezi had the highest EPR (47%) followed by Ankole (46%) and Bukedi sub-region had the lowest EPR at (23%). Map 10.1 & Table 10.2)

Map 10.1: EPR by Sub-region

10.3

According to this report, Status in Employment was classified into several categories: Employees, Paid Apprentices, Interns/Trainees, Employers (those who hire employees), Own-account Workers (those who do not hire employees), and Helpers (unpaid individuals involved in a family business). These categories are defined as follows:

- i. **Employees** This encompasses all types of employees, including permanent, fixed-term, short-term, and casual employees, along with paid apprentices and interns.
- ii. **Paid apprentice, intern, trainee-** A paid apprentice, intern, or trainee generally refers to individuals who are gaining work experience or training in a specific field while receiving compensation.
- iii. **Employer (with hired employees)** This group comprises individuals who own corporations as well as those operating household market enterprises.
- iv. **Own-account worker (without hired Employees)** This category includes owner-operators of corporations that do not have employees and own-account workers in household market enterprises without hired help.
- v. **Helper (without pay) in a family business** These individuals assist in a family business without receiving pay and are recognized as contributing family workers.

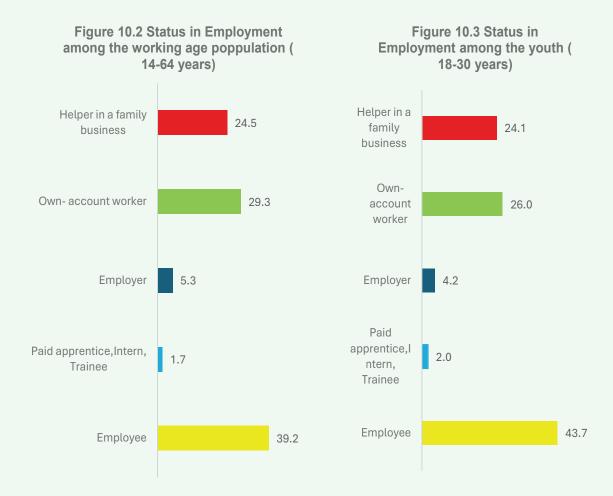

Patterns by background characteristics

- Findings showed that highest percentage of employed population were employees at 39% followed by Own account workers at 29 % while the lowest percentage were Paid apprentices, trainees or interns inclusive (1.7%) followed by employers 5.3% of the employed population (**Figure 10.2**)..
- The table also shows that there were more male employees (45%) compared to their female counterparts (33%). Majority of the employees had attained post-secondary and above level of education (68%). See **Table 10.3 for details.**

Most helpers in family businesses had no formal education (34%). Sex differences within this
category indicate that most were female, accounting for 30%, compared to 19% male.

This chapter will present a comprehensive set of indicators on youth aged **18 to 30 years**. According to Uganda's National Youth Council (NYC) Policy, the term "youth" specifically refers to individuals within **18 to 30-years**, which is consistent with the broader governmental framework. The statistics provided will serve as an important resource for evaluating the impact of national policies designed to integrate young people into critical development and decision-making processes, while also facilitating evidence-based planning for future youth-focused initiatives.

The employment pattern for youth aged 18-30 closely mirrors that of the working-age population (14-64 years). Most employed youth were employees (44%), followed by own-account workers (26%) and family business helpers (24%) (Table 10.4 & Figure 10.3).

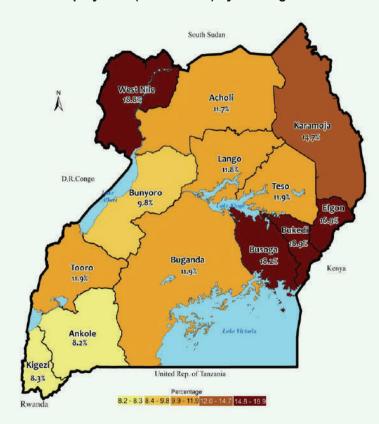

10.4 UNEMPLOYMENT RATE

According to the 20th International Conference of Labour Statisticians (ICLS) resolution of 2018, the International Classification of Status in Employment (ICSE-18) classifies jobs in employment for pay or profit into ten detailed categories based on the International Classification of Status in Employment concepts of type of authority (ICSE-18-A) and type of economic risk (ICSE-18-R).

Map. 10.2: Unemployment (14-64 Years) by Sub-region

- Nationally, 13% (approximately 1.2 million) of the population aged 14-64 years were unemployed during 2024. The unemployment rate of the female population (15%) was higher than that of the male population (11%)
- Education attainment differentials showed that the lowest unemployment rate was among persons with postsecondary plus education (9%) and those with no education (11%) while highest among persons that completed secondary education and those that completed some secondary education (15%).
- Bukedi and West Nile sub-regions had the highest unemployment rate (18.9%) and (18.8% respectively) while Kigezi and Ankole sub region had the lowest at eight percent. (Map 10.2 & Table 10.5).

10.4.1 YOUTH UNEMPLOYMENT RATE

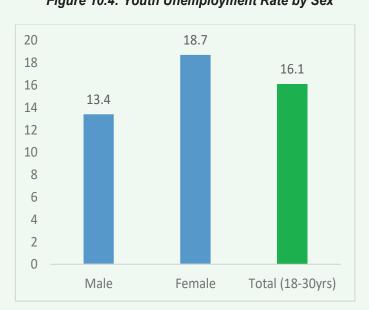

Figure 10.4: Youth Unemployment Rate by Sex

- Sixteen percent of the youth 18-30 years were unemployed. There were more female youth who were unemployed (19%) compared to their male youth counterparts (13%)
- Education attainment differentials showed that the highest youth unemployment rate was among persons who completed secondary level of education (19%). (Table 10.6 & Figure 10.4).

10.5 DURATION OF UNEMPLOYMENT

The NPHC 2024 asked all unemployed persons in the working age group how long they had been without work and trying to find a job or start a business. This question enables us to capture Long-term Unemployment indicator which is helpful in accessing how long one takes to get employed.

Long term unemployment refers to persons who have been unemployed for one year or longer.

Patterns by background characteristics

- Over a half 51% of the unemployed population had been looking for work or trying to start a business for over one year.
- Disaggregation by sub-region shows that Bukedi sub-region had the highest unemployed population who had been looking for work or trying to start a business for over one year (63%).
- Amongst unemployed population aged 14-64 years, majority (36%) had been jobless or without doing work for pay or profit for two and above. (Figure 10.5 & Table 10.7).

Figure 10.5 Duration of unemployment (14-64 years)

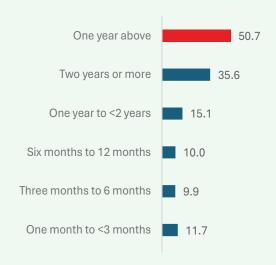

Figure 10.6 Duration of unemployment (18-30 years)

Patterns by background characteristics

- Overall, about 49% of the unemployed youth had been looking for work or trying to start a business for more than one year.
- It should be noted that (33%) of the youth had been jobless or without doing work for pay or profit for two years and above.
- Disaggregation by sub-region shows that Bukedi sub-region had the highest percentage of youth who had been jobless or without doing work for pay or profit for two years and above. (Figure 10.6 & Table 10.8)

10.6 POTENTIAL LABOURFORCE

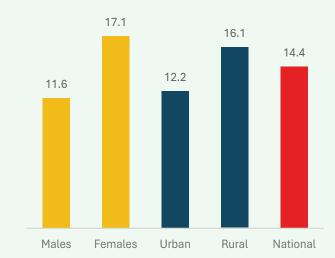

Potential Labour Force (PLF): refers to persons not in employment who expressed an interest in working for pay/profit but for whom existing conditions limit either their active job search or their availability to work.

This represents the population that was outside the Labour Force but expressed desire for employment despite limiting factors for search or availability expressed as a proportion of the extended Labour force

Figure 10.7 Potential Labour Force (14-64 Years)

Patterns by background characteristics

- NPHC 2024 findings show that the rate of Potential Labour force among persons aged 14 to 64 years was about 14 percent representing a population of approximately 1.8 million people outside the Labour Force but expressed desire for employment despite limiting factors for search or availability expressed as a proportion of the extended Labour force.
- The rate of potential labour force was higher among females (17%) was higher than that of males (12%) (Figure 10.7)

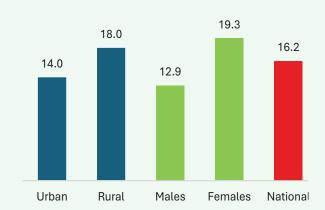

- Residential disaggregation shows that majority resided in the rural areas (16%) as compared to urban areas (12%).
- Regional variations show that Bukedi sub-region had the highest percentage of working age population in the potential labourforce (26%) while Ankole sub-region had the least working age population in the potential labourforce (8%)
- Findings also show that majority of the persons in the potential labour force had some primary level and some secondary level of education (17%). (Table 10.9)

Patterns by background characteristics

Findings show that the rate of Youth Potential Labour force among persons aged 18 years and 30 years was 16 percent representing youth population outside the Labour Force but expressed desire for employment despite limiting factors for search or availability expressed as a proportion of the extended Labour force.

Figure 10.8 Potential Labour Force among the youth (18-30 years)

- The rate of youth potential labour force was higher among females (19%) was higher than that of males (13%). (Figure 10.8 & Table 10.10)
- The Potential Labourforce was highest among persons residing in the rural areas (18%) compared to those in the urban areas (14%).

Map 10.3: Potential Labour Force (14-64 years),

Map 10.4: Potential Labour Force (18-30 years),

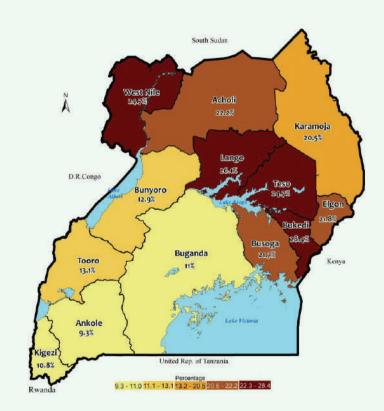

10.7 LABOUR FORCE PARTICIPATION RATE

Labour Force Participation Rate (LFPR) is the population in the labour force (employed and unemployed) expressed as a percentage of the working age population. It indicates the proportion of Working Age Population that is active in the labour market as either employed or actively looking and available for employment. This indicator shows the relative size of the supply of labour available for production of market goods and services in the country.

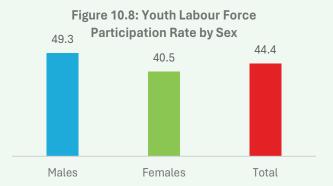

Map 10.3: LFPR by Sub-region

- The Labour Force Participation Rate (LFPR) was 43% with more males (48%) than females (39%) in the labour force.
- The findings show that LFPR increases with increasing level of education attainment.
- Buganda sub-region had the highest percentage of Labour force participation at (54%) while Bukedi sub-region had the least percentage (28%). (Table 10:9 & Map 10.3).

10.7.1 Youth Labour Force Participation Rate:

Youth Labour force Participation Rate was at 44 percent with males having the highest percentage at 49 percent more than their female counterparts having 41 %. (Table 10.12 & Figure 10.8).

10.8 ACTIVITY STATUS OF THE YOUTH

Activity status of the youth aged 18-30 years is classified into four categories 1.e Youth in Education, Youth in Employment and no longer attending School, Youth in Employment and attending School and Youth Not in Employment, Education or Training (NEET).

Youth Not in Employment, Education, or Training (NEET) refers to young people, typically within the age range of 15 to 24 or 15 to 30 (18 to 30 in the case of Uganda), who are not engaged in any form of employment, formal education, or vocational training. NEET is often used as an indicator to measure the socio-economic challenges faced by youth, as it highlights those who may be disconnected from opportunities for personal and professional development.

Patterns by background characteristics

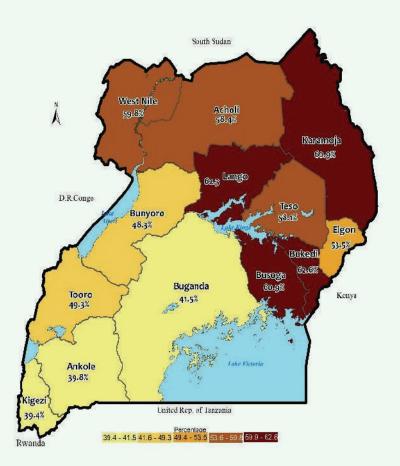

- Among the Ugandan Youth aged 18 to 30 years in 2024, 35 percent were no longer in school and werein employment, while 12 percent were still in school and about 51 percent were neither in employment nor education training. (Figure 10.9)
- Findings further show that, males (15%) and youth living in urban areas (13%) were more likely to be in school whereas females (58%) and rural youth (55%) were more likely to be neither in employment nor attending school (Table 10.13).

Figure 10.9 ACTIVITY STATUS OF THE YOUTH

Regional variations show that Bukedi, Lango and Karamoja subregion had the highest percentage of youth population Not in Employment, Education or Training (NEET) at 62% and 61% respectively. (Map 10.4).

Map 10.4: Youth Not in Employment, Education, or Training by sub-region, %

Key Findings

- Occupancy Tenure and type of dwelling units: 66% of households (7 million) lived in dwelling units that are owner occupied, 25% (2.7 million) lived in rented dwelling units.
 24% lived in semi-detached houses and 21% lived in huts.
- Construction material: 75% of households lived in dwelling units with iron sheet roofs,
 61% of households in Uganda lived in dwelling units with walls made of bricks. 31% of households in Uganda lived in dwelling units whose floors are made of cement screed
- Source of water for drinking: 81% of households had access to improved water source for drinking while 19 percent did not. 39% of the households used the borehole as their main source of drinking water
- Sanitation: 44 percent of households had improved sanitation facilities and 50 percent
 of households had unimproved sanitation facilities and 7% had no facility. 28% of
 households used shared toilets.60% of households in Karamoja did not have toilet
 facility (open defecation)
- Energy for cooking: 4% used clean energy and technology for cooking.
- Energy for lighting: 76% of households used clean energy for lighting
- Electricity: 25% of households used electricity and 28% used solar for lighting
- Method of solid waste disposal: 92% of households disposed off their waste improperly

ousing is a basic human right, essential for the well-being of all mankind. It is one of the basic human needs that have a profound impact on the health, welfare, social attitudes and economic productivity of the individual. SDG Goal 11 emphasizes the importance of ensuring access to safe, affordable, and adequate housing.

The NPHC 2024 collected data on the characteristics of households and the conditions of the dwelling units they lived in. These characteristics of dwellings and various aspects of households' living arrangements provide an important indication of the well-being of household members. The information included occupancy tenure, number of rooms used for sleeping and the main construction materials that were used. Information was also collected on other household characteristics including, main source of energy for cooking and lighting, main source of drinking water, type of sanitation facilities, availability of household assets and solid waste management in the households. However, such information was not collected for persons who were enumerated in institutions or accommodation facilities and therefore they are not included in this analysis. The analysis followed several dimensions that include; sub-regional distribution, residence, sex and wealth quintile.

11.1 Housing Conditions

The analysis of housing conditions is an important indicator for assessing the living conditions of a population. During the NPHC 2024, information was collected on materials used for construction of the roof, floor and wall of a dwelling unit. A dwelling unit is defined as a building or part of a building that is actually occupied by a single household and this is irrespective of the size of the household or building size.

11.1.1 Occupancy Tenure

Occupancy tenure is defined as the arrangements under which the household resides in the dwelling. The arrangements include owner occupancy, renting of dwelling, subsidized dwelling or free dwelling.

Free dwellings included both free public and free private housing. Occupancy tenure of a dwelling unit has implications on security of tenure of the household. The results in Table 11.1 show that overall, 66 percent of households (7 million) lived in dwelling units that were owner occupied and 25% of households (2.7million) lived in rented. Disaggregation of occupancy tenure of dwelling units by sub region show varying degree of status of dwelling units. Teso had the most (83%) owner occupied dwelling units, followed by Bukedi, Karamoja and Kigezi (82% respectively) and Buganda had the least (45%). On the other hand, Buganda (44%) had the most rented dwelling units and Karamoja had the least (6%).

Figure 11.1 shows that the majority of households in rural areas were living in owner occupied dwellings (77%) while in urban areas, it stood at 49 percent. On the other hand, the biggest proportion of households in urban areas (42%) lived in rented dwelling units compared to 13 percent in rural areas.

Figure 11.1: Distribution of households by Occupancy tenure of dwelling unit by residence

11.1.2 Characteristics of Dwelling Units

Table 11.2 indicates that 24 percent of the dwelling units were semi-detached, 21 percent were huts and 20 percent were tenement (muzigo). Slightly a higher proportion female headed households were in tenement (muzigo) (21%) compared to male headed households (19%). Variation by residence shows that 33 percent of households in urban areas lived in Tenement (Muzigo) compared to 11 percent in rural areas. Sub regional disaggregation shows that 38 percent of households in Buganda lived in tenements (muzigo) compared to 2 percent that lived in huts. Notably, Karamoja (79%) had the biggest proportion of households living in huts.

11.1.3 Construction Materials of dwelling units

The type of materials used to construct the household's dwelling unit gives a general picture of the structural condition of the building based on durability and permanency of the materials and also provides a general indication of the socioeconomic status of the household.

Table 11.3 shows that overall, 75 percent of the households lived in dwelling units with iron sheets while 21 percent lived in those with thatched roofs. There were variations in the type of roofing materials by subregion. Kigezi sub region had the highest percentage (98%) of households whose dwelling units had iron sheets followed by Ankole sub region (95%) while Karamoja had the lowest (15%). Karamoja had the highest percentage of households with thatched roof dwellings (75%) followed by Acholi (71%).

Good quality wall materials ensure household members are protected from harsh weather conditions and from exposure to hazardous factors. The distribution of households by construction material of the wall reveals that 61 percent of households in Uganda lived in dwelling units with walls made of bricks while 21 percent of households were living in dwelling units with walls made of mud and pole.

Considering the construction materials of the floor, the results show that, overall, 31 percent of households in Uganda lived in dwelling units whose floors are made of cement screed.

11.1.4 Measures of Overcrowding

Crowding or housing density is a key measure of housing quality. The three most commonly used measures of crowding are persons per room, floor per person and households per dwelling unit (United National Development Group, 2003).

In this measure, a household is overcrowded if more than three persons sleep in the same room.

11.1.5 Number of rooms for sleeping

The number of sleeping rooms provides an indication of the extent of crowding in households. Overcrowded rooms have health implications arising from, among others, disturbed sleep. More importantly, crowded living conditions increase the risk of the spread of infectious diseases, such as meningococcal disease, tuberculosis and respiratory infections

Table 11.4 indicates that the biggest proportion of the households (53%) used one room for sleeping while 29 percent used two rooms, both accounting for 81 percent of the households (8.7 million). There was a slight difference among female headed and male headed households that used one room for sleeping (52% and 53% respectively). Karamoja sub region had the biggest percentage of households (70%) that used one room for sleeping whereas Kigezi sub region had 33% of households sleeping in one room.

Variations in residence show that 58 percent of households in urban areas used one room for sleeping compared to 49 percent in rural areas.

Figure 11.2 presents some overcrowding indicators from the NPHC 2024. The room occupancy density is the number of people per household that slept in a room. The overall average room occupancy density was 3 percent. The results show that 56 percent of households had over crowded dwellings with 50 percent in urban areas and 41 percent in rural areas.

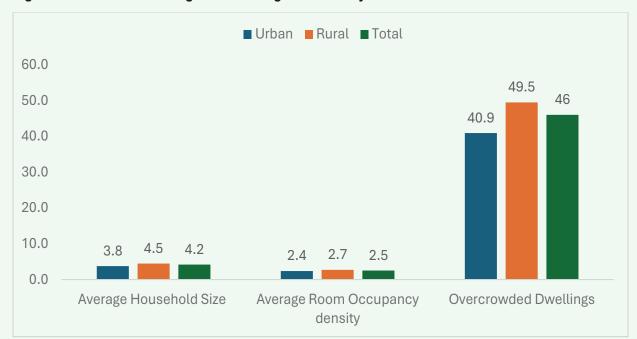

Figure 11.2 Selected Housing overcrowding indicators by sex of the household head

11.2 Household Sanitation and Hygiene

The World Health Organization (WHO) defines household sanitation as the provision of facilities and services for safe disposal of human waste as well as garbage.

Proper sanitation is very crucial to the health of a population. The Sustainable Development Goal (SDG) 3 of "Good Health and Well Being" stresses the need for good sanitation and easy access to health services for all, hence universal access to good sanitation is a key priority of the Government of Uganda.

The NPHC 2024 collected information on the source of water for drinking, types of toilet facilities used by households and solid waste disposal. This information is presented in this chapter to study sanitation and health characteristics of the households and the individuals staying in these households.

11.2.1 Main Source of Water for drinking

Access to safe water and good sanitation is very crucial to the health of a population. Unimproved water sources and poor sanitation increase the risk of water borne diseases and illnesses due to poor hygiene causing a burden on service delivery through increased demand for health care. During the NPHC 2024, information on the main source of water for drinking and distance to main source of water for drinking were used as the proxy indicators for access to safe water in a household.

Improved drinking water sources are those that, by nature of its construction or through active intervention, is likely to be protected from outside contamination. (UNICEF). Improved drinking water may be contaminated with human or animal faeces containing pathogens, or with chemical and physical contaminants with harmful effects on child health and development.

The NPHC 2024 defined improved water sources to include: piped water, boreholes, protected springs, bottled water and unimproved drinking water sources included unprotected well/spring, vendor, tanker truck, rain water and river/lake

Table 11.5 shows that 81 percent of households (8.7 million) had access to improved water source for drinking while 19 percent (2 million) had access to unimproved water sources. Variations in residence show that 87% of households in urban areas had access to improved water source for drinking compared to 77% in rural areas. The results further reveal that 39 percent of the households (4.2 million) use the borehole as their main source of drinking water and this is higher in rural areas (49%) compared to urban areas (25%).

One of the barriers to use of safe water is the long distances to the sources. Figure 11.3 shows that eighty-one percent of households were within a distance of less than one kilometre from an improved water source. Buganda (84%) had the highest percentage of households that reported that they were within one kilometre to a safe water source while Karamoja sub-region (62%) reported the lowest.

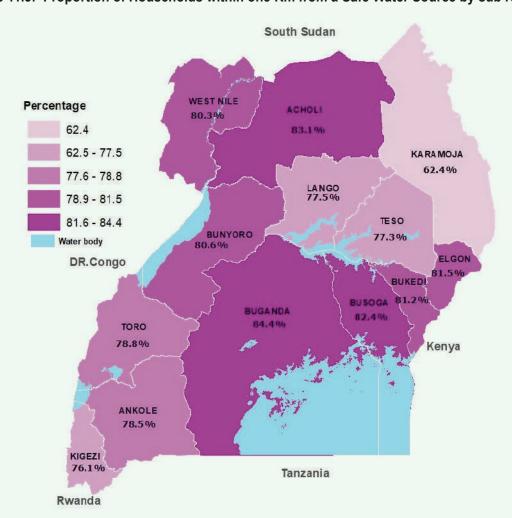

Figure 11.3: Proportion of Households within one Km from a Safe Water Source by sub region

11.2.2 Type of Toilet Facility used

Basic sanitation is defined as an improved toilet facility that is not shared with any other household and limited sanitation was defined is an improved facility that was shared with another household.

Improved toilet facilities include the flush toilets, VIP latrines, covered pit latrines with a slab and Ecosan

The World Health Organization underpins safe disposal of human waste as one of key measures to reduce diarrheal disease transmission. Results in Table 11.6 show that 44 percent of the households (4.7 million) had improved sanitation facilities as compared to 50 percent (5.3 million) that had unimproved sanitation facilities. The proportion of households with improved sanitation facilities was higher in urban areas (61%) compared to 32 percent in rural areas. Overall, 7 percent of households (715 thousand) had no facility (open defecation) and this was higher among households in rural areas (9%) compared to 3 percent in urban areas. Proportion of households that had shared toilet facilities regardless of whether they were improved or unimproved was 28 percent.

Results in Figure 11.4 show that Karamoja (60%) had the highest proportion of households with no facility (open defecation) as compared to Kigezi with 1%.

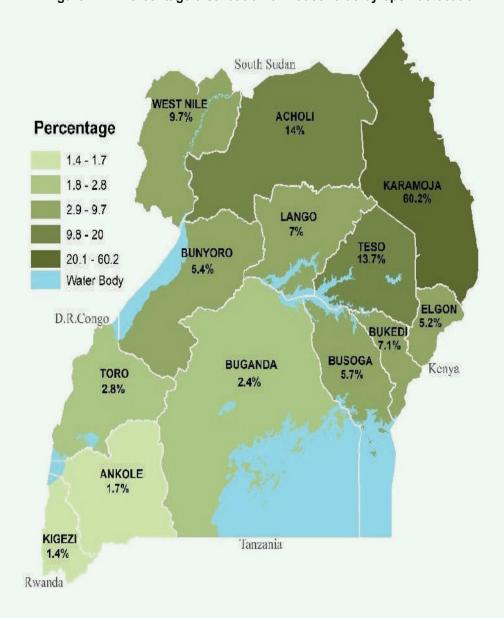

Figure 11.4: Percentage distribution of Households by open defecation

Table 11.7 show the distribution of households by type of toilet facility and selected background characteristics. The results show that 25 percent of households in Uganda used a covered pit latrine without a slab as their main toilet facility. The results further show that 7 percent of households had no toilet facility. Disaggregation by sub region shows that 60% of households in Karamoja did not have any toilet facility. Kigezi sub region (37%) had the highest proportion of households that used a covered pit latrine without a slab compared to 10 percent of households in Karamoja.

Figure 11.5 provides information that relates to toilet facilities used by households. The results show that the percentage of households with improved sanitation facilities was 44 percent compared to 50 percent of households with unimproved sanitation facilities.

The proportion of improved sanitation facilities was higher (61%) among households in urban areas compared to 32 percent among households in rural areas. Seven percent of households did not have any sanitation facility (open defecation).

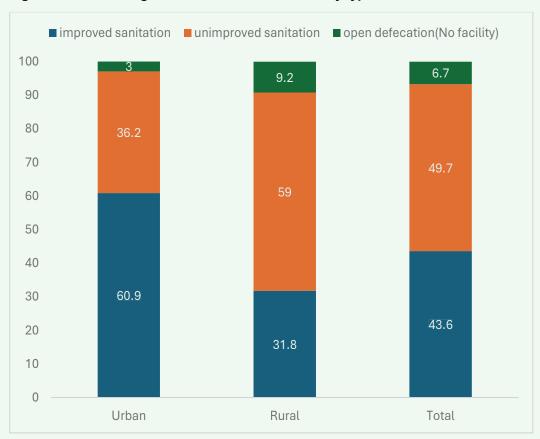

Figure 11.5: Percentage Distribution of households by type of Toilet Facilities

11.2.3 Hand washing facility

Hand washing after toilet use protects against communicable diseases. Availability of hand washing facilities at or near the toilet can be used as a proxy measure of hygiene after toilet use. SDG 6 Target 6.2 aims to achieve access to adequate and equitable sanitation and hygiene for all and end open defecation. Indicator 6.2.1: Proportion of population using safely managed sanitation services, including a hand-washing facility with soap and water, is used to monitor progress towards this goal.

Table 11.8 provides information on availability of hand washing facilities in households and the use of water and soap. Overall, 47 percent of households (10 million) had a hand washing facility next to the toilet. Ten percent of households had hand washing facilities with water only, 24 percent had facilities with water and soap while 13 percent did not have water and soap.

By sub region, more than half (57%) of households in Buganda had hand washing facilities while Acholi (30%) had the least proportion of households with hand washing facilities.

11.2.4 Household Bathrooms

The NPHC 2024 sought for information on the type of bathroom the household mainly used. Results in Figure 11.6 show that overall, three in every ten households (33%) used outside built bathrooms with drainage, followed by outside built with no drainage (29%).

Table 11.9 further shows that the biggest proportion (41%) of households in the urban areas used outside built bathrooms with a drainage provided as compared to 28 percent of households in rural areas. By sub-regions Teso

(26%) had the biggest proportion of households using makeshift type of bathroom. Overall, 9 percent of the households had no bathroom with the highest proportion observed in Karamoja sub region (44%)

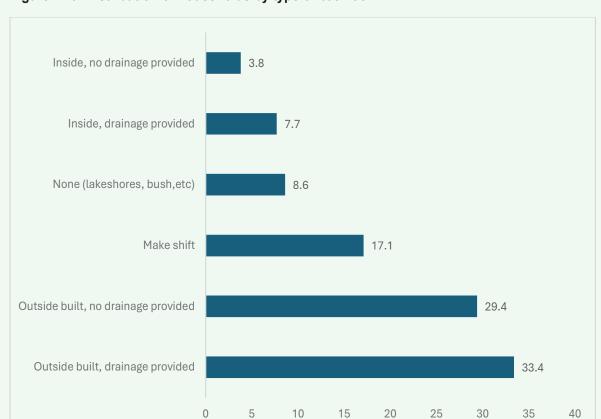

Figure 11.6: Distribution of households by type of bathroom

11.2.5 Solid Waste Disposal

Household waste management has both environmental and health implications on individuals and communities. Improper disposal of waste by households has been a key contributor to flooding in urban centers due to blockage of drainage channels and also leads to proliferation and breeding of disease-causing agents; vectors like mosquitoes and flies, rodents like rats and bacteria in the environment leading to disease outbreaks such as malaria, cholera, dysentery, typhoid among others. Waste has been highlighted as a key contributor to climate change and as a key emitter of methane gas generated through the decomposition of biodegradable waste.

11.2.6 Method of solid waste disposal

Proper waste disposal methods included: local dump supervised and Waste vendor

Improper waste disposal methods included: Garden, Burning, Pit, Local dump-unsupervised, river/sea/stream/pond, Bush and other

Table 11.10 presents information collected from households on their most commonly used method of solid waste disposal. The results show that, overall majority (92%) of the households (9.8 million) in Uganda disposed off their rubbish improperly. Improper waste disposal was higher among households in rural areas (98%) compared to 82 percent of households in urban areas.

At sub-regional level, all sub regions had more than 90 percent of their households using improper methods of waste disposal besides Buganda with 80 percent. Almost all households in Karamoja (99%), Teso (99%), Lango and West Nile (99%) used improper methods of waste disposal. Figure 11.7

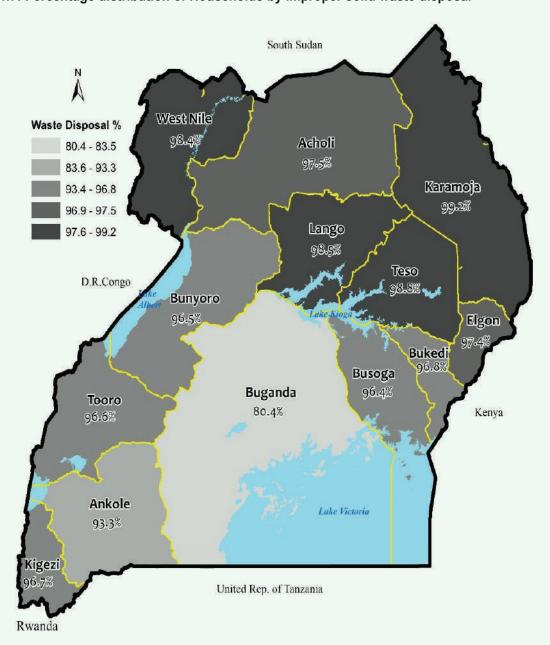

Figure 11.7: Percentage distribution of Households by improper solid waste disposal

11.3 Household Energy Consumption

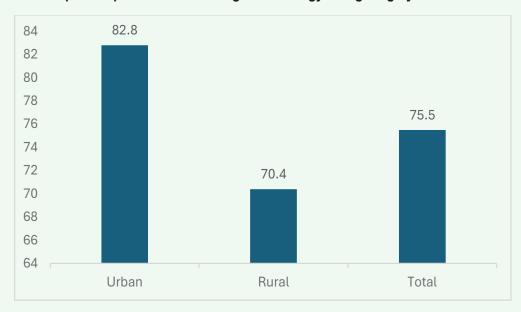

Electricity is one of the basic necessities of modern living. The use of clean energy and renewable energy sources would reduce the reliance on wood fuel for cooking and ultimately protect natural resources. More so, clean power would improve the health of women through reduced exposure to smoke from wood fuels.

SDG 7 requires member states to ensure access to affordable, reliable, sustainable and modern energy for all. Both the National Development Plan III and Uganda's Vision 2040 recognise that energy and in particular, electricity is a driver of socio-economic transformation of a nation. The government's policy vision for renewable energy is to make modern renewable energy a substantial part of the national energy consumption.

11.3.1 Source of energy for Lighting

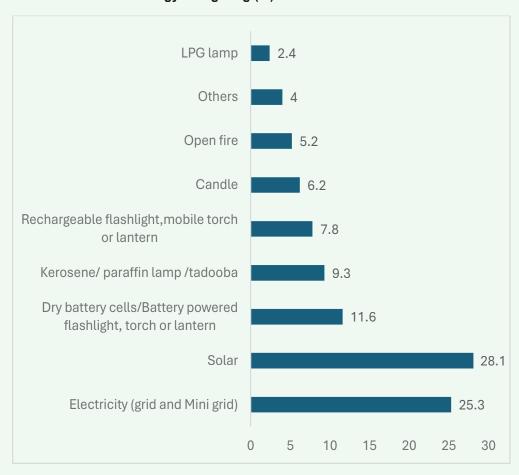

The main source of energy for lighting is an important indicator in assessing quality of housing welfare or households. The findings in figure 11.8 show that overall, 76 percent of households (8.1 million) used clean energy for lighting. The proportion of households using clean energy for lighting was higher in urban areas (83%) compared to those in rural areas (70%).

Figure 11.8: Proportion pf households using clean energy for lighting by residence

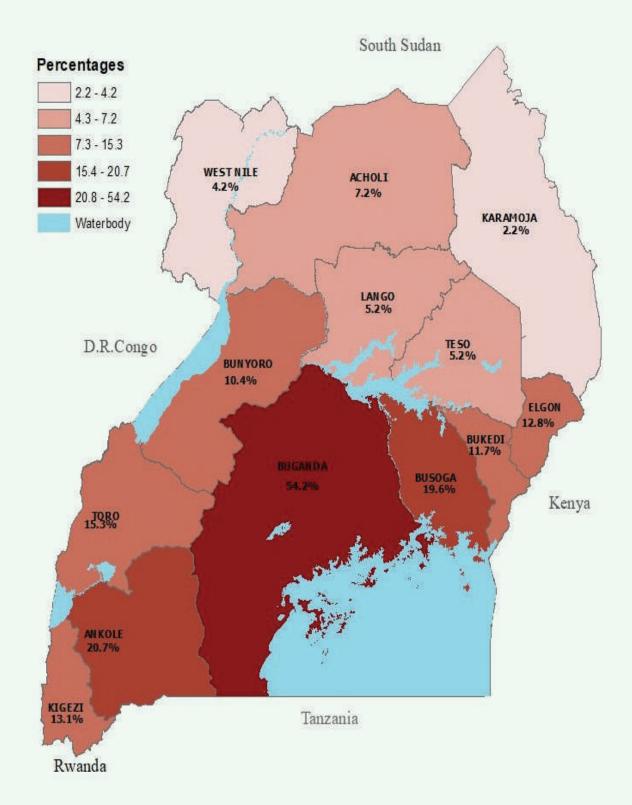

The findings in figure 11.9 show that solar (28%) was the main source of lighting accounting to 3 million households, followed by electricity (grid) (25%) accounting to 2.7 million households and the least used source of energy for lighting was LPG lamp (2%). Use of electricity (excluding solar) increased from 21 percent in 2014 to 25 percent in 2024.

Figure 11.9: Main source of energy for lighting (%)

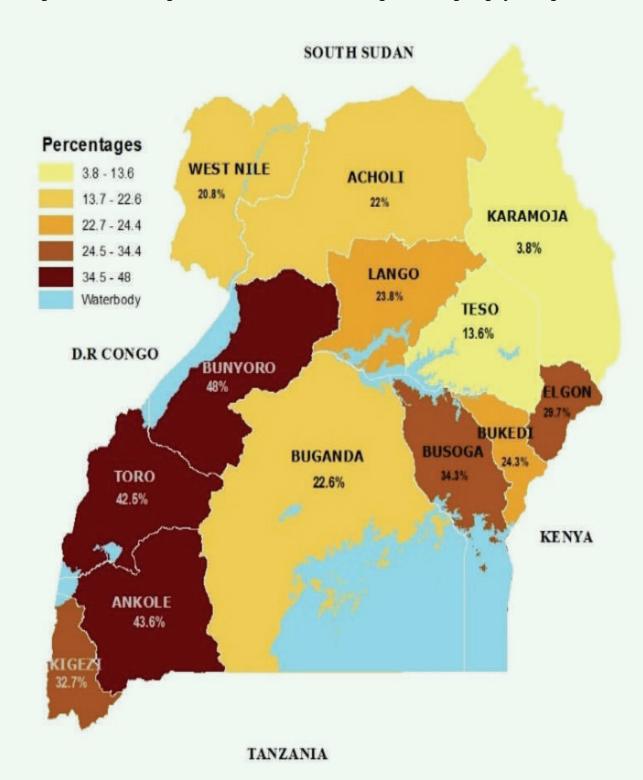

Overall, 25 percent of households had electricity (grid) for lighting. **Table 11.11.** Results in Figure 11.10 further show that Buganda subregion had the biggest proportion of households (54%) that had electricity (grid) for lighting, followed by Ankole (21%) while Karamoja had the least proportion with 2%.

Figure 11.10: Percentage distribution of households using electricity for lighting by subregion

The results in Figure 11.11 show that 28 percent of households use solar energy for lighting. By subregion, Bunyoro (48%) had the biggest proportion of households with solar energy for lighting while Karamoja (4%) had the least.

Figure 11.11: Percentage distribution of households using solar for lighting by subregion

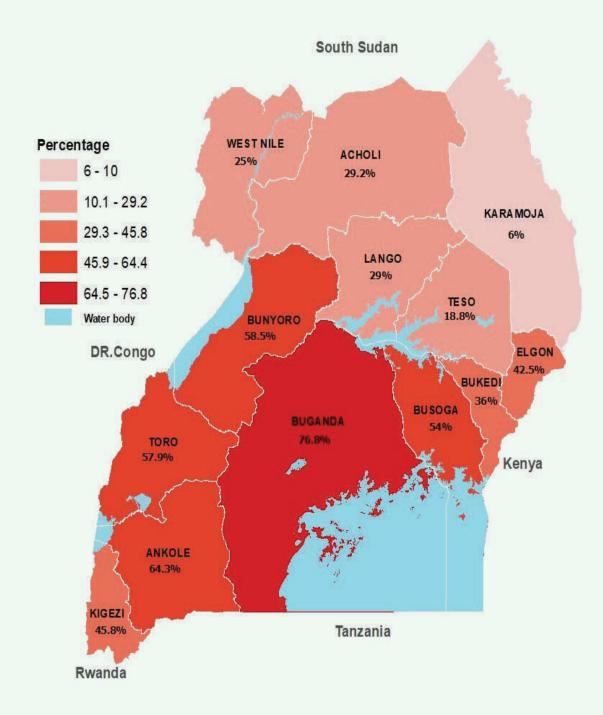

Figure 11.12: Percentage distribution of households using solar or electricity for lighting by subregion

11.3.2 Source of energy for cooking

The sources of energy and technology used for cooking may impact on the health status of household members and the environment around them. The Government through the Ministry of Energy and Mineral Development (MEMD) is promoting the use of efficient cooking technologies so as to reduce the pressure on the trees and forest resources, reduce pollution and save financial resources of households.

Figure 11.13 shows that overall, 4 percent of households were using clean fuel and technology for cooking. The variations in residence show that 7 percent of households in urban areas were using clean fuel and technology for cooking as compared to 2 percent of those in rural areas.

Figure 11.13: Percentage distribution of households using clean fuels for cooking

11.3.3 Household Kitchen Type

The place where cooking is done, coupled with the type of fuel and stove used, influences indoor air quality and the degree to which household members are exposed to the risk of respiratory infections and other diseases

Information was gathered on the types of kitchens and cooking stoves used for cooking by the household members. A kitchen located inside the dwelling unit that uses wood fuel is a health hazard to the inhabitants of the dwelling because of the high chances of inhaling smoke.

The findings in Table 11.12 shows distribution of households by the main cooking stove used. Fifty seven percent of the households used three stone stoves for cooking followed by traditional solid fuel stove (sigiri) (25%) while 4 percent do not cook at all.

Table 11.13 summarises the distribution of households by type of kitchen. At national level, 42 percent of households used an outside built kitchen, in a separate room, 30 percent did their cooking in open space. Forty seven percent of households in urban areas had outside built kitchen, in a separate room as compared to 35 percent in rural areas.

Variations in sub regions show that Karamoja (56%) had the highest proportion of households cooking in open spaces followed by West Nile and Bunyoro (37%). Kigezi sub-region (59%) had the highest percentage of households cooking in built kitchens outside the dwelling in a separate room followed by Bukedi, Teso and Lango each with 54% while Karamoja (13%) had the least.

11.3.4 Main source of fuel for cooking

The dependence on wood fuel for cooking impacts negatively on the health of the person using it and the environment. The data on main source of cooking energy is shown in Table 11.14 and Figure 11.14. The results in table 11.14 show that firewood was the main source of energy for cooking, accounting for 62 percent of the households. Eighty nine percent of the households stated that they used wood fuel for cooking (firewood and charcoal). The proportion of households depending on wood fuel only reduced from 72 percent in 2014 to 62 percent in 2024.

Figure 11.14 shows that there was a reduction in the proportion of households using firewood for cooking from 72 percent to 62 percent and also a slight increase in the proportion of households using charcoal from 23 percent in 2014 to 27 percent in 2024.

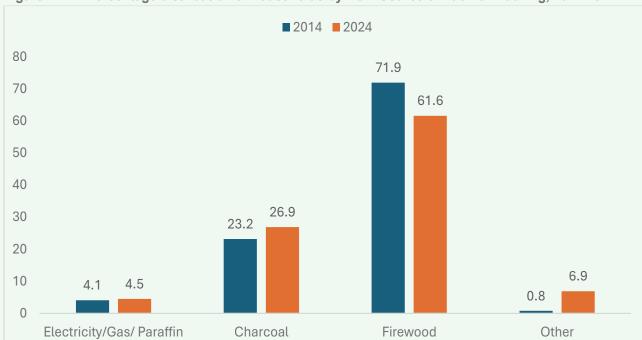

Figure 11.14: Percentage distribution of households by Main Source of Fuel for Cooking, 2014-2024

LIST OF TABLES

For more information on housing and household characteristics, see the following tables:

SUBSISTENCE ECONOMY AND HOUSEHOLD WELFARE

Key Findings

- Households in Subsistence and Non-Subsistence Economy: Thirty-three percent of Ugandan households (3.5 million) were in the subsistence economy in 2024 compared to 67 percent (7.2 million) in the non-subsistence economy.
- Characteristics of Households in Subsistence and Non-Subsistence Economy: Among the 3.5 million households in the subsistence economy, 75 percent primarily relied on subsistence agriculture, 10 percent focused mainly on income-generating activities, and 15 percent earned wages or salaries.
- Households in Subsistence and Non-Subsistence Economy by Sub-Regions: The Karamoja sub-region accounted for the highest proportion of households in the subsistence economy, representing 71 percent. Within this sub-region, most of these households—42 percent—were involved in subsistence farming.
- Ownership of clothing: Sixty-nine percent owned both shoes and a set of clothing necessities.
- Ownership of Assets: Sixty-six households owned dwelling units at the time of the census with a lower proportion of households owning agricultural land (47%)
- Households Owning Dwelling Units/ Houses: Overall, 66 percent of the households own dwelling units / houses. More males (67%) than females (63%) own their houses.
- **Households Owning Land:** Overall, 47 percent of the households' own land. More males (51 %) than females (31%) own their land.
- Proportion of the Population owning Land: overall, 17 percent of the population in Uganda owns land. SDG 1.4.2; Proportion of total adult population with secure tenure rights to land, with legally recognized documentation.
- Adult Population that Owns Land. Overall, 31 percent of the adult population aged 18 years and above owns land
- Adult Population with Land Title deed. 58% of the adult population that own land, have title deed / Legal documents of land ownership
- **Transport Assets:** Bicycle is the most owned transport Asset. 26 percent of the HHs own a bicycle. A motor engine is the least owned transport asset by only
- **Remittances:** Findings shows that, out of 10.6 million households interviewed in Uganda, 155,200 households received remittances during the last 12 months preceding the census.

H

ouseholds categorized within the subsistence economy, as defined by the Uganda Bureau of Statistics, are those unable to satisfy their fundamental needs, regardless of their engagement in economic activities.

32 Households in Subsis

Essential household requirements encompass both food and non-food items. The assessment of a household's poverty status and its capacity to fulfill these basic needs is crucial in identifying those within the subsistence economy. This category includes households involved in subsistence farming, those receiving wages that fall short of meeting basic necessities, businesses generating insufficient returns, and households that are entirely inactive and unable to meet their basic requirements, often living at or below the poverty line.

Conversely, households classified outside the subsistence economy belong to the non-subsistence or monetary economy. These households are characterized by their ability to adequately meet their basic needs. The accompanying table offers a comprehensive overview of the distinctions between the subsistence economy and the non-subsistence or monetary economy.

Table 12.1: Household topography for subsistence economy

Household typology	Description
Subsistence Economy (a+b+c+d)	
a) Subsistence Farming Households	All household members engaged in agriculture mainly for own or family use but partly for sale/barter
b) Wage/Salary earning households living below the poverty line	At least one member of the household is engaged in Wage/Salary employment but lives along/below poverty line
c) Income generating Enterprise with members living along/below the poverty line	At least one member of the household is engaged in income generating enterprise excluding subsistence farming but lives along/below poverty line
d) Non-working below the poverty line	No household member is working, may earn from transfers, donations, pensions.
Non-Subsistence Economy (a+b+c)	
a) Wage/Salary earning households	At least one member of the household is engaged in wage/Salary
	employment & above the Poverty Line
b) Income generating Enterprise	At least one member of the household is engaged in income generating enterprise subsistence farming and is above the poverty line
c) Not working-above Poverty line	All household members are not working and above the poverty line

12.1 Household in Subsistence and Non-Subsistence Economy

The findings in table 12.1 indicate that 33 percent of households (3.5 million) were in the subsistence economy in 2024 compared to 67 percent (7.2 million) in the non-subsistence economy.

12.2 Patterns by background characteristics

Out of the 3.5 million households in subsistence economy, seventy-five percent of households were engaged mainly in subsistence agriculture; 15 percent were earning a wage/salary and 10 percent were mainly engaged in income generating activities. Of the 7.2 million households in the non-subsistence economy (money economy) in 2024, 76 percent were earning a wage/salary and 14 percent had an income generating business enterprise. All households in this category were living above the poverty line and as such able to meet their basic needs.

Households in Subsistence

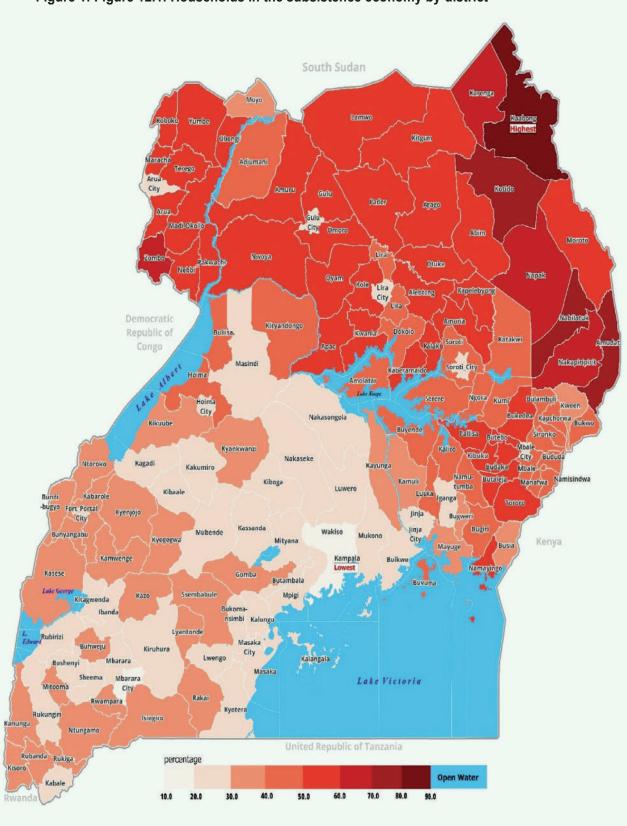

Figure 1: Figure 12.1: Households in the subsistence economy by district

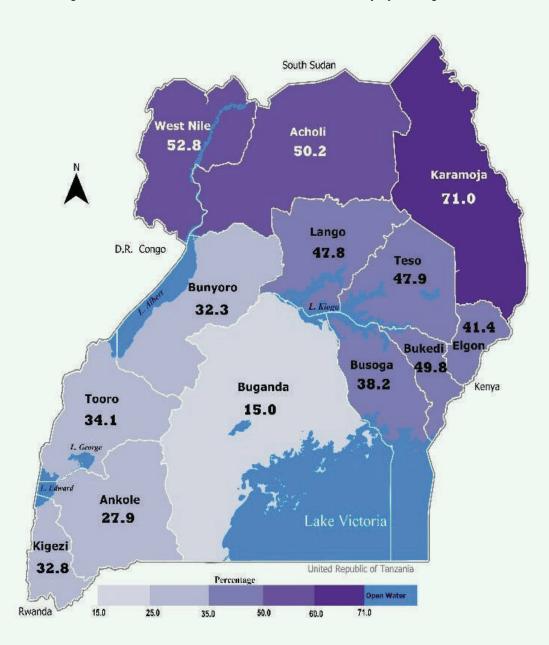

12.3 Characteristics of Household in Subsistence and Non-Subsistence Economy

The Table 12. 2 shows that among the sub-regions, Karamoja had the largest share of households under the subsistence economy (71%) and the largest share of households contributing to the subsistence economy within the Karamoja subregion were households engaging in subsistence farming (42%). The West Nile sub-region had the second largest share of households under the subsistence economy (53%) and majority of these households were engaged in subsistence farming (41%).

The Buganda sub-region had the lowest share of households under the subsistence economy (15%) and majority of these households were engaged in subsistence farming (10%). (**Table 12.2 and Figure 12.2**).

Figure 12.2: Subsistence Households

Percentage distribution of households in subsistence economy by subregion

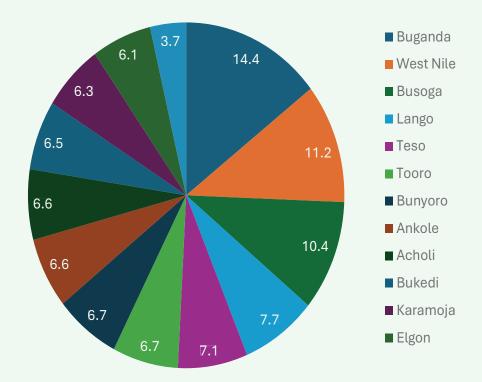

12.4 Patterns by Subregion

This covers the percentage distribution of households engaged in subsistence and non-subsistence economies across various sub-regions in 2024.

Figure 12.3 shows that, majority of households in the subsistence economy were in Buganda subregion (14%) followed by West Nile (11%) and Busoga (10%) while, majority of households in the non-subsistence economy were also in Buganda sub-region (41%) followed by Ankole (9%) and Busoga (8%). (**Table 12.2 and Figure 12.3**).

Figure 12.3: Distribution of Households in the subsistence economy by subregion

Percentage of Households in subsistence economy

Household assets owned

Asset ownership is an important indicator of wealth and is a useful proxy for characterizing livelihood security of households. For individuals and households, asset ownership translates to a secure place to live, means to earn a livelihood, and the ability to mitigate the economic and social risks associated with natural disasters, disease, and economic shocks (Doss, Grown, and Deere 2008). Ownership of Assets, therefore, refers to personal property irrespective of the purpose it serves. During the NPHC 2024, any asset owned by any member of the household was treated as a household asset, however, only functional assets were considered.

Ownership of clothing and shoes

Ownership of Clothing and shoes

Ability to own clothing and shoes is an indicator of the wellbeing of a household. The 2024 NPHC collected information on selected basic necessities including ownership of clothing.

Ownership of clothing and shoes serves as a basic measure of household welfare, reflecting both economic capability and social status. These items are not merely functional; they also symbolize personal dignity and community standing. Similarly, the ownership of selected assets, such as land, livestock, and household appliances; serves as a critical indicator of wealth and security. Assets can provide a safety net during times of crisis, enhance productivity, and generate additional income streams. The NPHC 2024 asked whether every member in the household had at least two sets of clothing or have at least one pair of shoes and asked whether the household received any remittances in the last two months.

The results show that about seven in ten households (69%) owned both shoes and a set of clothing necessities with male headed households having a higher percentage (70%) than female headed households (67.3%). Regional disaggregation show that Karamoja sub-region had the lowest percentage of households that owned at least a set of clothing or a pair of shoes at 57% and 38% respectively. (Table 12.4 and Figure 12.4).

Figure 12.4: Ownership of Clothing and shoes by Selected Characteristics

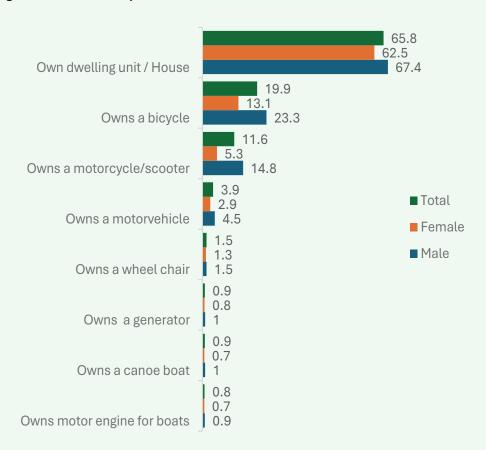

Ownership of selected Household Assets

The NPHC 2024 collected information on ownership of various types of assets such non-movable assets (house/dwelling unit, land), transport assets (bicycle, motorcycle/scooter, motor vehicle truck, motor vehicle saloon car, motor vehicle minibus, motor vehicle bus), and other assets (generator).

Figure 12.5 presents the broad categories of household assets owned disaggregated by the sex of the household head. Findings indicate that 66 percent of households owned their dwelling units / houses. Differentials by sex showed that a slightly higher proportion of male headed households (67%) than those headed by their female counter parts (63%) owned dwelling units / houses. About half (47%) of the households reported owning their own land. It was also noted that more male headed households (52%) than female headed households (38%) own land (**Table 12.5**).

A higher proportion of the households (20%) owned a bicycle,12 percent owned a motorcycle/scooter while less than one percent of household reported owning an engine boat as a transport asset. The proportion of male headed households that reported owning a bicycle (23%) was almost double those owned by female headed households (13%). By sub region, Lango (47%) and Teso (41%) had the highest proportion of households that reported owning bicycles (**Table 12.5**). By subregion, household land ownership was highest in Lango sub-region (68%), followed by Kigezi (67%) and lowest in Buganda Sub-region (31%).

Land Ownership

Land is a fundamental resource that facilitates the development and fruition of the various aspects of human life including agriculture, housing and industrial activities. It serves as a critical factor of production and a cornerstone for economic development and environmental sustainability. Land ownership in Uganda plays a pivotal role in economic growth and development.

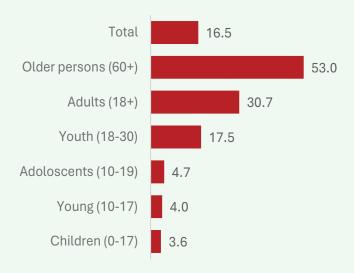

The United Nations Agenda 2030, Goal 1 target 1.4 strives to achieve equal rights to economic resources, as well as access to basic services, ownership and control over land and other forms of property, inheritance, natural resources, appropriate new technology and financial services, including microfinance. The relevant part of Target 1.4 is measured through Indicator 1.4.2; Proportion of total adult population with secure tenure rights to land, (a) with legally recognized documentation, and (b) who perceive their rights to land as secure, by sex and type of tenure.

The structure of land tenure systems in Uganda which includes customary, freehold, leasehold and mailo land significantly influences land use and productivity. Secure land ownership provides individuals and businesses with the confidence to invest in land improvements, leading to increased agricultural productivity, enhanced property values and overall economic stability. Formal land titles and documents of land ownership enable landowners to access credit and financial services by using their land as collateral. This access to credit stimulates economic growth by facilitating income generating ventures, job creation and poverty reduction (Qursum,2022).

Ownership of Land and legal documents of ownership

The NPHC 2024 collected information on ownership of land and legal documents of ownership of land (title deed, certificate of ownership, certificate of hereditary acquisition) with their names own it. Information was collected for adults (persons aged 10years and above) on whether they own land "alone", "jointly", "both jointly and alone" or "not". Overall, 17 percent of the population own land. Disaggregation by age groups showed that 53 percent of older persons aged 60 years and above, adults 18 years and above (31%) and youth (18%) owned land. (Figure 12.6). Sex differentials showed that ownership of land was higher among the males (19%) than females (14%).

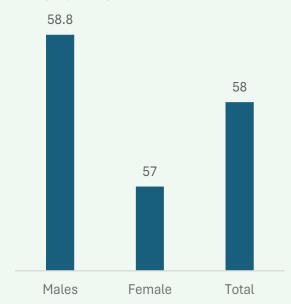

Legal documentation

SDG 1.4.2 measures the proportion of total adult population with secure tenure rights to land, with legally recognized documentation. Analysis for this indicator considered adults as persons aged eighteen years and above.

Overall, 58 percentage of the adult population aged 18 and above reported to have documents for their land with names on it. There was very small difference between males (58%) and females (57%) with land title/document.

Figure 12.7: Proportion of total adult population with secure tenure rights to land, With legally recognized documentation (%)

Patterns by subregion

Further breakdown by subregion showed that Buganda subregion (77%) had the highest proportion of person that have land with legally recognized documentation, followed by Kigezi sub region (71%) as shown in figure 12.8.

By special age groups, 61 percent of the older persons (60+) and adults (18+) as well as 58 percent of the youth (18-30) and adolescents (10-19) reported owning land with legally recognised documentation.

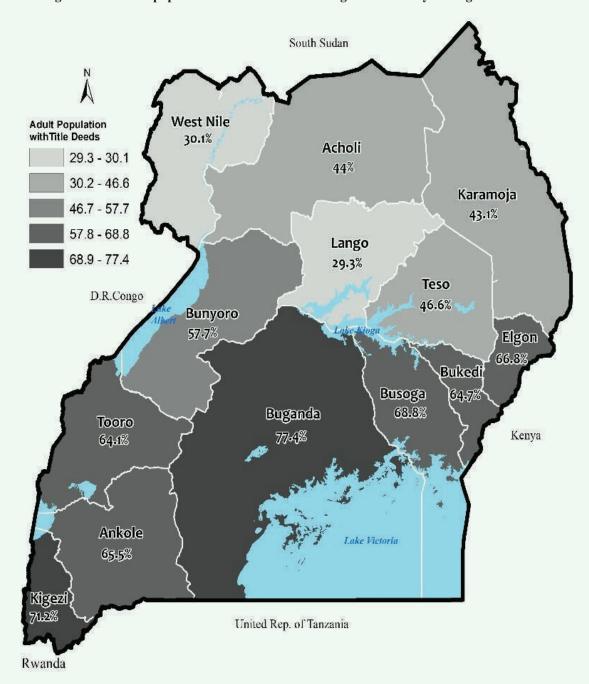

Figure 12.8: Adult population with secure tenure rights to land by subregion

12.5 Remittances

Remittances are household incomes originating from foreign economies, primarily due to the temporary or permanent migration of individuals to those countries. These transfers include both cash and non-cash items, sent through formal channels like electronic transfers, or informal means such as money or goods physically transported across borders. Remittances largely consist of funds and goods sent by individuals who have settled abroad, as well as the net earnings of cross-border, seasonal, or short-term workers employed in an economy where they do not reside.

The NPHC 2024 asked respondents if their household had received any money or physical items from family members, relatives, or friends living outside Uganda over the past 12 months.

Notably, remittances play a crucial role in supporting household income, highlighting the need to evaluate how reliant households are on external financial aid. This data is essential for shaping policies that align with national development plans.

12.5.1 Households receiving remittances

Findings shows that, out of 10.6 million households interviewed in Uganda, 155, 200 received remittances during the last 12 months preceding the NPHC 2024. The results show that Buganda subregion had the highest number of households that received remittances (85,529) followed by Ankole sub-region (10,482), with Karamoja sub-region recording the lowest numbers (2.354) of households that received remittances followed by Lango sub-region (2,574) households. In terms of education level for the household head, findings showed that households with heads of households who completed post-secondary level of education received more remittances (Table 12.10 & Figure 12.9)

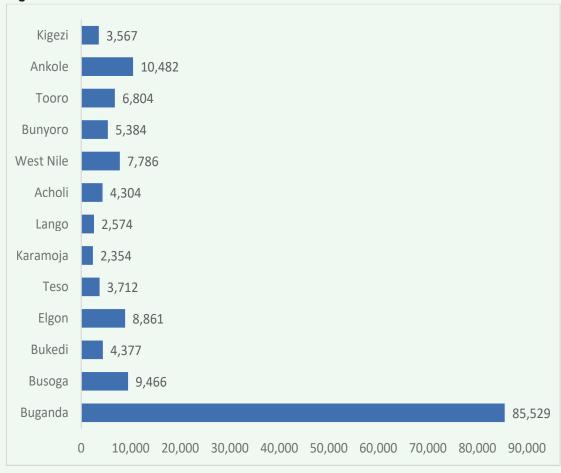

Figure 12.9: Number of Households that received remittances in the last 12 months

Patterns by Age groups

Disaggregation of household heads by age in relation to remittances showed that the majority of remittances in the 12 months preceding the census were received by households with heads aged 31 to 59 years, followed by those headed by youth (18-30 years). Households with heads aged 10 to 17 years received the least remittances. (**table 12.10**).

12.5.2 Forms of remittance received by households

The census generated information about the form of remittance received by household members from emigrants. Remittances from emigrants to their households may take the form of money, goods, or a combination of both, each significantly contributing to household well-being.

The findings indicated that most households received remittances in the form of money (75%), followed by goods (16%), and about nine percent received both cash and goods. (**Figure 12.10**).

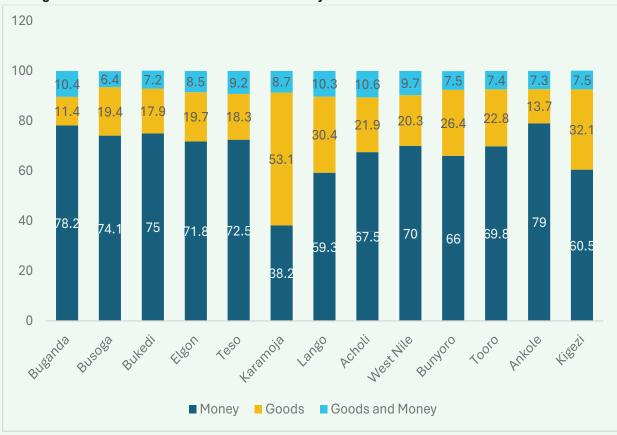

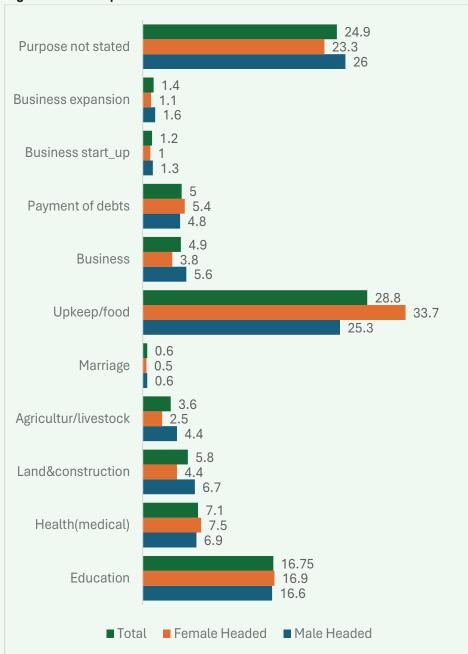

Figure 12.10: Forms of Remittances received by households

12.5.3 Purpose of remittance

Figure 12.11: Purpose of remittance received

Households that received remittances in the 12 months prior to the census were asked about the purpose of these funds. Among the 155,200 households that received remittances, most maleheaded households did not state the purpose of the remittance received (26%), followed by upkeep/food (25%), followed by education (17%). In contrast, among female-headed households, the most common use of remittances was for upkeep/food (34%), followed by purpose not stated (23%), followed by education (17%) (Figure 12.11)

ACCESS TO FINANCIAL SERVICES

Key Findings

- Saving Mechanisms: Mobile money was the most used mechanism for saving (20%) followed by keeping cash at home (17%).
- Availability of Financial Services: VSLAs were the most common, with 75% of the parishes having at least one VSLA.
 Mobile money services were in 69% of the parishes
- **Beneficiaries of Government Programs:** SAGE has the highest percentage (18%) of beneficiaries of a government program.

inancial inclusion is defined as having access to and using a broad range of quality and affordable financial services which help ensure a person's financial security. It is a vital component of Uganda's economic development, enabling citizens to access essential financial services and participate in the formal economy. This section provides an overview of the current state of financial inclusion in Uganda exploring both formal and informal financial institutions in expanding access to financial services.

Formal institutions include Banked (Commercial Banks, Credit institutions and Micro Finance Depositing Institutions) Non-bank (SACCOs and Mobile Money) while Informal institutions include Savings groups like Village Savings and Loans Associations (VSLAs), Rotating Savings and Credit Associations (ROSCAs), Merry – Go Rounds and Investment clubs. Those who excluded are neither formal nor informally included for example those keeping cash at home and keeping cash or with a family member.

13.1 Saving mechanisms

Savings are an important determinant of both individual and national wellbeing. Typically, households employ a wide range of mechanisms for saving. The choice of savings mechanism has important microand macroeconomic implications. Household respondents were asked which the type of saving mechanisms used in the last 12 months preceding the NPHC 2024.

Figure 13.1 shows the Population aged 16 years and above split among savers and non-savers, 42 percent of the population were saving money using the different mechanisms of saving as listed above and 58 percent were not saving at all.

Figure 13.1: Savers and non-savers.

Table 13.1 shows that overall, saving money on mobile money was the most used mechanism for saving (20%) followed by keeping cash at home (17%). Only 7 percent were using commercial banks as savings mechanisms. Variations were observed by sex and sub-regions. Among the sub-regions, Buganda had the highest number of savers with the most used mechanism being mobile money (28%) West Nile had its highest percentage of the population keeping cash at home (19%). The highest percentage of those saving with SACCOs (10%) were from Bunyoro sub region.

The highest percentage of those using commercial banks (13%) were from Buganda sub region and the least percentage of those who were using commercial banks (2.2%) was from west Nile subregion.

13.2 Usage of Financial Institutions for saving

The NPHC2024 sought to assess how Ugandans aged 16 years and above used different financial services providers to save money. The results were used as a proxy indication for use of financial inclusion.

Figure 13.2 shows that overall, the highest percentage (28%) of the population used formal saving mechanisms. Fig 13.2 also indicates that overall, a higher percentage of male savers (30%) in Uganda use formal institutions compared to female savers (25%). However, there are more female savers using informal institutions (15%) compared to their male counterparts (11%). There was no differential in sex of persons that used excluded mechanisms (19% each).

Figure 13.2: Percentage distribution of savers by mode of financial inclusion

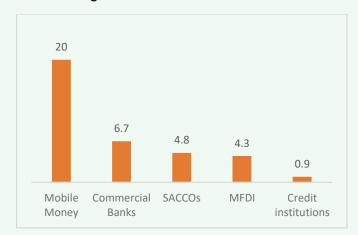

Table 13.2 shows that biggest percentage (20%) of those who used excluded mechanisms of saving were living in rural areas. The biggest percentage (64%) of those who used formal mechanisms of saving were people who attained post-secondary levels of education and above. Buganda sub region had the highest percentage (37.4%) of users of formal institutions to save and it also had the least percentage (9%) of users of informal institutions

13.3 Usage of Formal Financial Institutions for saving

The results indicate that mobile money (20%) recorded the highest proportion that used formal service providers for saving, followed thereafter by Commercial banks with (7%) of the population, 5 percent of the population used SACCOs for saving and the least proportion of savers (1%) who use formal institutions use credit institutions

Figure 13.3: Percentage distribution of savers using formal institutions.

13.4 Availability of Financial Services.

During the NPHC 2024, community-level data was collected on the type of financial institutions which existed in the communities; with a focus on money lenders, mobile money agents, banking agents, commercial banks, Village Savings and Loan Associations (VSLAs), Micro-Finance Institutions (MFIs), Deposit Taking Institutions and Savings and Credit Co-operatives (SACCOs).

The NPHC 2024 collected information on availability of selected financial services in the LC1 villages throughout the country. The findings presented in Table 13.3 show that Village savings and Loan Associations (VSLAs) were the highest available financial service providers (76%) followed by mobile money agents (69%). Parishes reporting availability of a SACCO with a physical location were at (46%).

Among formal banking institutions, banking agents were the commonly available financial institutions as registered in 13% of the parishes.

Commercial banks and DTIs were the least available (2% and 2% respectively).

The common financial institutions were the VSLAs, with upto 76% of the parishes having reported to have VSLA in their communities.

Figure 13.4 Percentage of parishes with access to the different financial institutions

Patterns by Background Characteristics:

As shown in Table 13.3, the results reveal that West Nile sub region had VSLAs in 93 percent of their parishes while Elgon Sub-region had 55 percent of parishes with a VSLA. Buganda sub-region reported the highest percentage of parishes having mobile money agents (87%) while Karamoja had the lowest (29%).

Results on availability of a SACCO with a physical address also show that overall, 46 percent of the parishes in Uganda had a SACCO. The highest percentage was reported in Teso (58%) and the lowest in Kigezi (35%). See Table 13.3 for details.

Overall, with the exception of VSLA that is available in Rural (76%) and urban (75%) areas, all the categories of the financial services were more common in urban areas compared to rural areas. This is more evident for the money lenders (40% compared to 25%), and banking agents (22% compared to 7%)

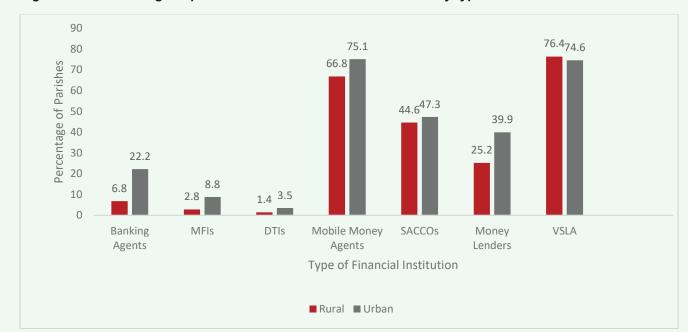

Figure 13.5: Percentage of parishes with the financial institutions by type

13.5 Access and Utilization of Mobile Money Services

This section looks at the access and use of mobile money services in Uganda. Mobile money can be defined as an electronic wallet service that enables one to send and receive money anywhere using a mobile/cellular phone. Table 13.4 shows that overall, 32 percent of the population used Mobile money services in the 30 days before the day of enumeration. It also reveals that 26 percent of those who transacted used their own registered mobile money accounts followed by 3 percent who used mobile money agents or other registered mobile money accounts. Higher percentage of males (34%) made mobile money transactions 30 days prior to the enumeration date than females (30%). At least every four in ten persons aged 25-54 years had transacted using mobile money in the 30 days preceding the census.

13.6 Government Programs

Effective governance and social development are critical for improving the well-being of citizens. The Government of Uganda has a multitude of government programs including.

- The Social Assistance Grants for Empowerment (SAGE). The targeted age group for this
 grant is persons aged 80 and above. In Table 13.5, SAGE had the highest percentage of
 beneficiaries of a government programme at 18 percent. This loosely means that 18 percent of
 those aged 80 plus have ever received the grant.
- National Agriculture Advisory Services (NAADS) The overall goal of NAADS interventions
 is to contribute to increased commercialisation and competitiveness of agricultural production,
 value addition and agro processing for improved household food security and incomes. Table
 13.5 shows that NAADs was the second most benefited from government programme with 14
 percent overall beneficiaries. More females (15%) benefited from this programme than men
 (12%)
- Special Enterprise Grant for Older Persons (SEGOP) aged 60-79 years. The grant is to provide financial support to older persons for income generation. The beneficiaries of this grant are 7 percent of the target population.

- Operation Wealth Creation (OWC) is a government intervention to efficiently facilitate national socio-economic transformation, with a focus on raising household incomes and wealth creation by transforming subsistence farmers into commercial farmers to end poverty. This question was asked to the population aged 18 years and above and 0.4 percent of the population were beneficiaries.
- The Youth Livelihood Programme (YLP) The Programme Development Objective is to empower the target youth to harness their socio-economic potential and increase self-employment opportunities and income levels. The target population is persons aged 18 to 30 years.
- The Uganda Women Entrepreneurship Programme (UWEP) is an initiative of the Government of Uganda that is aimed at improving access to financial services for women and equipping them with skills for enterprise growth, value addition and marketing of their products and services and 1 percent of women aged 18 and above have received the grant.
- Parish Development Model (PDM) is the last mile strategy for service delivery by Government of Uganda for improving incomes and welfare of all Ugandans at the household level. PDM provided to household heads 18 years and above. Of the households in subsistence economy, 23.4 percent benefitted from the parish development model. See Table 13.6 for details

For more information on access to financial services, refer to the tables below.

248

14

Key Findings

Land Cover: 68 percent of the parishes in the country had wetlands, 60 percent had Natural water bodies and 44 percent, Natural forests/woodlands.

National encroachment and degradation figures:

Wetlands – Reported by 51% of the Parishes Natural Forests/Woodlands – Reported by 37% of Parishes Natural Water Bodies – Reported by 27% of the Parishes

Climate Change: 76 percent of the parishes reported change in rain seasons, while 42 percent reported an increase in temperatures.

Climate-related Disasters: Climate-Related Disasters which were experienced the most by the communities were famine and drought, reported by 64 percent of the parishes.

Effects of Disasters: The greatest effect of disasters in communities was damage to crops, as reported by 81 percent of the parishes.

Solid Waste Management: Overall, only 39 percent of households in Uganda sorted solid waste

E-waste: About two in ten (19%) of households in Uganda had a household member with a non-functional electronic or electrical equipment due for disposal.

E-Waste Disposal Methods

Burning – 31% of Households

Mixed with other waste – 13% of Households

Kept waste at home – 12% of Households

Sold to door-to-door E-waste collectors – 8% of Households

Collected by Government collectors - 2% of Households

conomic Growth Strategy of the NDP III focuses on five key objectives which include exploitation of natural resource endowments with environmental protection in mind. The NPHC 2024 community data collection on environment was directed towards establishing availability of wetlands, natural forest/woodlands and natural water bodies, including the status of encroachment on these natural resource endowments.

Uganda seeks to ensure that there is appropriate adaptation and mitigation strategies on Climate change to realize sustainable industrialization agenda. The NDP III has highlighted the climate change agenda as a critical factor for sustainable exploitation of the key growth opportunities of agriculture, minerals, petroleum and tourism, and increased incomes and quality of life. (NPA, 2020)

14.1 LAND COVER

Land cover refers to the observed physical cover on the earth's surface, including vegetation (natural or planted) and human constructions¹. It can include features such as water bodies, forests, grasslands, wetlands, bare soil, snow or ice, urban areas, industrial sites, and agriculture. Land cover is fundamentally distinct from land use, despite their potential overlap. While land cover signifies the physical state of the earth's surface, land use refers to how humans utilize the land. Knowledge of land cover is used in areas like urban planning, environmental management, disaster risk reduction, and climate change studies, among others.

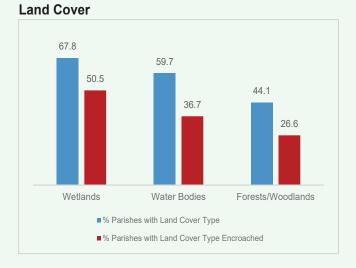

The NPHC 2024 collected data on the availability of wetlands, natural forests/woodland and natural water bodies for all the Parishes in Uganda. Some are transboundary spanning multiple parishes. These natural endowments are critical because they support human life through production of essential goods and services and as well acting as biodiversity conservation systems specifically natural habitats for wildlife and various plant species. Availability of these resources increases the socio-economic prospects and resilience of the community through ensuring sustainable food production, diversification of livelihood sources, provision of water for domestic and production, biodiversity conservation and related benefits, erosion and flood control, rain formation and climate stability through carbon sequestration, waste-water purification, among others. This therefore makes it essential to protect them against damage to ensure optimization of their benefits across generations.

Results presented in Figure 14.1 show that 68 percent of the parishes in the country had wetlands. Also, 60 percent had water bodies while 44 percent forests/woodlands. The results further show that a relatively higher percentage of parishes (51%) had the wetlands encroached and degraded as compared to only 37 percent for water bodies and 27 percent for forests/woodlands.

Results in Table 14.1 show that in Lango sub-region, encroachment and degradation of wetlands was in 72 percent of the parishes. This was followed by

Bunyoro (70%). Encroachment of the wetlands was least in Karamoja sub-region (11%)

Fig. 14.1: Percentage of Parishes with Encroached

¹ FAO definition. https://www.fao.org/4/x0596e/X0596e01e.htm

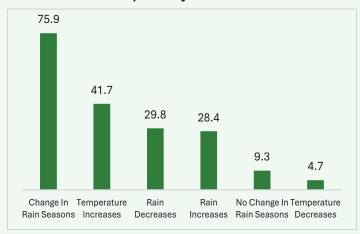

14.2 Climate Change

Climate change refers to long-term shifts in temperatures and weather patterns. Such shifts can be natural but have been mostly accelerated by human activities including Fossil fuel use, deforestation, and some agricultural and industrial practices. Climate change is a global issue and Uganda is ranked among the vulnerable countries due to its limited capacity to cope but also, the country's population highly depends on the Environment and Natural resources sector for survival. Uganda is highly agro-based with majority depending on rain for Agriculture where any climate shock creates significant damage and loss.

Climate change therefore impacts economic activities including agricultural production through animal and plant heat stress, water and energy instability, destruction of infrastructure, disrupted human mobility and access to markets for goods and services, slowed industrialization and increased disease burden, among others. With rising greenhouse gas emissions, climate change is occurring at rates much faster than anticipated and if left unchecked might reverse development made over the past years and provoke mass migrations that can lead to instability of the country.

Results in Figure 14.2 show that overall, 76 percent of the parishes reported change in rain seasons, while 42 percent reported an increase in temperatures. Only five percent of the parishes reported a decrease in temperatures. A small number of parishes reported a change in the amount of rain; with 30 percent reporting a decrease and 28 percent registering an increase. Results also show that less than ten percent of the parishes reported having experienced no change in the climate. Sub-regional results on the changes which were observed in the climate are presented in Table 14.2

Fig 14.2: Percentage of Parishes by reported difference in the climate over the past 10 years

14.2.1 Climate-related Disasters

Climate related disasters are events that cause serious harm to people, loss and damage to infrastructure, economies, or the environment, and the affected community cannot handle it alone. These types of disasters are mainly as a result of extreme weather conditions like extreme temperatures and natural hazards like floods and earthquakes. It should be noted however that human actions can make climate related shocks worse.

The high population growth rate in Uganda is accelerating the need to increase food production to sustain the growing population coupled with other factors like poverty are exerting a lot of pressure on natural resources through unsustainable use which is threatening their status and ability to fulfill their functions. This is increasing the vulnerability and risk of different communities against climate change shocks.

Information was collected on the different disasters which were experienced by and affected the communities in the twelve months before the Census night. The climate-related disasters have been selected to include: floods, drought, famine, landslides, hail/wind storm, soil erosion, and lightning.

Figure 14.3 shows that the disasters most experienced by the communities were famine and drought as reported in 64% of the parishes per disaster. Landslides were the least reported, by only 12 percent of the parishes.

Table 14.3 presents the results by region with two-thirds of parishes in Eastern and 82 percent of parishes in Northern reporting having experienced drought. Additionally, a high percentage of parishes in Northern (81%) and Eastern (73%) region experienced famine.

Across sub regions, Karamoja had the highest proportion of parishes that experienced drought (92%) and famine (87%). The percentages are high for the rural areas as compared to the urban areas across all the disasters on which information was collected.

14.2.2 Effects of the Disasters in the Communities

Community-level data was collected on the effects of disasters on communities. The types of effects were general, and not specific to the community.

Results in Figure 14.4 show that the greatest effect of disasters in communities was damage to crops, as reported by 81 percent of the parishes. Effects on people included; missing people, loss of human life, human displacement and injury. More results on the effects of disasters faced by communities are presented in Table 14.4.

Fig 14.3: Percentage of Parishes by Type of Shock experienced 12 months Preceding the Census

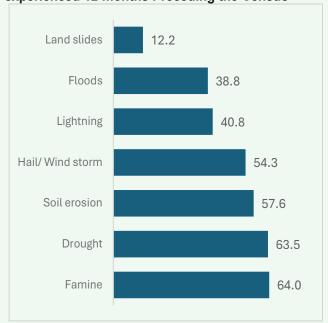

Fig 14.4: Percentage of Parishes by Effect of Disaster

14.3 Solid Waste Management

This section will cover aspects of solid waste management. As indicated in section 14.3, results showed that overall, 92 percent of the households in Uganda disposed their solid waste improperly. Household waste management has both environmental and health implications on individuals and communities. Improper disposal of waste by households has been a key contributor to flooding in urban centers due to blockage of drainage channels and leads to proliferation and breeding of disease-causing agents; vectors like mosquitoes and flies, rodents like rats and bacteria in the environment leading to disease outbreaks such as malaria, cholera, dysentery, typhoid among others. Waste has been highlighted as a key contributor to climate change and as a key emitter of methane gas generated through the decomposition of biodegradable waste.

14.3.1 Waste Sorting

Waste sorting is the process of separating waste into different elements. Waste is mostly sorted into two categories; Biodegradable (materials which decompose) and non-biodegradable (materials which do not decompose).

Sorting at household level is done for purposes of proper waste management like recycling including turning organic waste into manure, feeds for animals, briquettes and the inorganic materials like plastic given/sold to recyclers for material recovery. Waste sorting supports the national circular economy agenda and is a prerequisite for building effective and efficient waste management strategies by facilitating recycling, reducing amount of waste to be collected and disposed hence reducing general costs of waste management. It also significantly reduces waste pollution and methane emissions from waste which are a key contributor to climate change.

Figure 14.5 presents information collected from households on their waste sorting practices. The results show that, overall, 39 percent of households in Uganda sorted solid waste. At sub region level, Kigezi sub region (48%) had the highest percentage of households that sorted solid waste followed by Ankole (47%) while Karamoja (30%) had the least percentage of households that sorted solid waste.

Fig. 14.5: Map of Uganda Showing Percentage of Households by Solid Waste Sorting Practices

14.3.2 E-waste

Waste of Electronic and Electrical equipment (WEEE) also commonly known as E-Waste is defined as all discarded electrical and electronic assemblies, scrap, components and batteries. E-Waste includes a broad range and growing number of electronic devices ranging from large household appliances such as refrigerators and air conditioners, to personal products such as handheld cellular phones, personal stereos, consumer electronics and computers among others.

E-Waste is considered as one of the fastest growing waste streams globally and one of the new environmental threats arising out of huge global sales of Electric and Electronic Equipment (EEE), with symmetric volumes of waste generated after, whose disposal is a complicated process especially for developing countries such as Uganda. It requires proper handling and disposal because some of the components of electronic and electrical equipment are hazardous and harmful to public health and a contributor to climate change as a source of Green House gas emissions.

Figure 14.6 presents information collected from households on possession of a non-functional electronic or electrical equipment which was due for disposal. The results show that, overall, 19 percent of households in Uganda had a household member with a non-functional electronic or electrical equipment.

At sub region level, Kigezi and Teso sub regions had the highest percentage of households (21 percent) each with a non-functional electronic or electrical equipment followed by Buganda, Lango, Acholi and West Nile sub regions with 20 percent each. Karamoja sub region had the least percentage of households (11 percent) with a non-functional electronic or electrical equipment. More sub-regional results on E-waste are presented in Table 14.5.

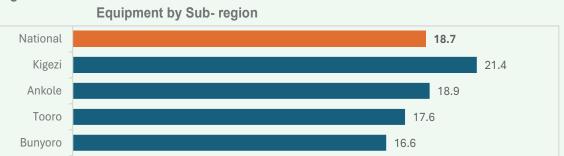

Fig 14.6: Distribution of households in Possession of Non-functional Electronic or Electrical

14.3.3 E-Waste Disposal

Results presented in **Table** 14.6 provide information collected from households on their most used method of E- waste disposal. The results show that, overall, 31 percent of households in Uganda disposed their E-waste by burning, 13 percent mixed it with other waste, 12 percent kept the waste at home, 8 percent reported that they sell it to door-to-door E-waste collectors while only 2 percent is collected by Government collectors.

There were sub-regional variations in method of E-waste disposal. Karamoja sub-region had the highest percentage of households that disposed of their E-wastes by burning (46%) followed by West Nile sub-region (38%). Mixing E-waste with other domestic waste for disposal was most common in Kigezi, Ankole and Tooro sub-regions with 14% each. E-Waste door to door collectors were predominant in Buganda (15%) and Ankole (10%) compared to other sub-regions.

DISABILITY AND MENTAL HEALTH

Key Findings

- Multiple disability: Twenty one percent of the persons with disabilities had multiple functional difficulties
- Little persons: Little persons comprised two percent of the population aged 18 years and above.
- Albinism: Persons with albinism comprised less than one percent of the population aged two years and above
- Neurological disorder: The most common neurological disorder was Cerebral palsy (2%), followed by Spina bifida (1%)
- Probable psychological distress: 18 percent of the population aged 10 years and above had experienced psychological distress.

he Persons with Disabilities Act, 2020 (as amended) defines disability as a substantial functional limitation of a person's daily life activities caused by physical, mental or sensory impairment and environment barriers, resulting in limited participation in society on equal basis with others.

The categories of disability as defined in the Act include Physical disability caused by cerebral palsy, amputation of a limb, paralysis or deformity; Hearing disability including deafness and hard of hearing; Visual disability including blindness and low vision; Deaf and blind; Mental disability including psychiatric disability and learning disability; little people, Albinism and Multiple disability.

The United Nations Agenda for 2030 (SDGs), the third National Development Plan (NDP III) and the National Disability Act 2020 advocate for equal opportunities for enhanced empowerment, participation and protection of rights of Persons with Disabilities (PWDs) irrespective of gender, age and type of disability. PWDs have the same socio-economic, political and cultural needs. These include education, employment, health, ownership of property, marriage, transport and communication. Statistics on disability is therefore necessary to address policy formulation and programming in line with the above.

The NPHC 2024 included a series of questions based on the recommended Short Set from the framework of the World Health Organization's International Classification of Functioning, Disability, and Health (ICF, 2001). The questions address six core functional domains namely, Seeing, Hearing, Walking or Climbing stairs, Remembering or Concentrating, Self-care and Communicating. The questions, therefore, provide basic necessary information on disability comparable at an international level using the WG disability tools.

The NPHC 2024 collected information on de facto population aged 2 years and above on whether they had "no difficulty", "some difficulty", "a lot of difficulty", or "could not do at all" in any of the six functional domains.

Functional domains

- (i). Seeing (ii). Hearing (iii). Communicating (iv). Remembering or concentrating
- (v). Walking or climbing steps and (vi). Self-care (washing all over or dressing).

Eligibility: Population age 2 years and above.

15.1 Functional difficulties

Functional difficulties refer to limitations in performing activities of daily life due to physical, cognitive or sensory impairments. The difficulties have a significant impact on individuals' lives and require comprehensive support and interventions. Understanding the nature and extent of functional difficulties is essential for providing appropriate care and services. The proportion of persons who reported having difficulties in these functional domains is presented in this section.

Nine in every ten persons aged two years and above had no difficulty in any of the domains, namely Speech difficulty (97%), Self-care (96%), Walking (95%), Hearing (95%), Seeing (95%) and Remembering (94%) (Table 15.1).

Table 15.1: Proportion of persons aged 2 years and above by functional difficulty and level of severity level

Disability domain	No, difficulty	Some difficulty	A lot of difficulty	Cannot do at all
Seeing difficulty	94.6	4.5	0.8	0.1
Hearing difficulty	94.7	4.5	0.7	0.1
Walking difficulty	94.5	4.3	1.1	0.2
Remembering difficulty	94.3	4.7	0.9	0.1
Self-care difficulty	95.9	3.1	0.7	0.3
Speech difficulty	96.8	2.5	0.5	0.2

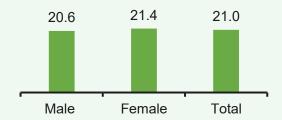

15.2 Multiple disability

An individual is considered to have multiple disabilities if he/she had a combination of functional difficulties.

Twenty one percent of the persons with disabilities had multiple functional difficulties.

The proportion was the same for both males and females at 21 percent.

Figure 15.1: Prevalence of multiple disability

15.3 Little persons

The NPHC 2024 defined a little person as a genetic or medical condition that usually results in an adult height of 147 centimeters (4 feet 10 inches) or shorter. The average adult height among people with dwarfism is 4 feet (122 cm). Information on little persons was captured for those 18 years and more.

Little persons comprised two percent of the population aged 18 years and above with slightly more males (2%) than females (1%). above (**Figure 15.2 and table 15.4**)

15.4 Albinism

The NPHC 2024 manual defined persons with albinism as those born with an absence of skin and hair pigmentation. This usually results in having pale hair, eyes and skin.

Persons with albinism comprised less than one percent of the population aged two years and above (**Table 15.4**)

Figure 15.2: Proportion of little persons and persons with albinism

15.5 Forms of impairments

The NPHC 2024 collected information on forms of impairments including deaf and hard of hearing, blind and low vision and neurological disorders.

15.5.1 Deaf and hard of hearing

Deafness is a condition of total loss in hearing. In the NPHC 2024, this was considered as "cannot do at all" for the hearing domain where as hard of hearing was considered as "A lot of difficulty".

The results show that less than one percent of the population had deafness and one percent had hard of hearing condition. (**Table 15.5**).

Patterns:

 Deafness and hard of hearing conditions were most prevalent among persons aged 80 years and above at one percent and nine percent respectively (Table 15.5).

15.5.2 Blind and low vision disability

A person is considered "blind" or having "low vision" if he/she recorded "cannot see at all" and "a lot of difficulty" respectively in the seeing domain. The results show that less than one percent of the population were blind and one percent had low vision (**Table 15.5**).

Patterns:

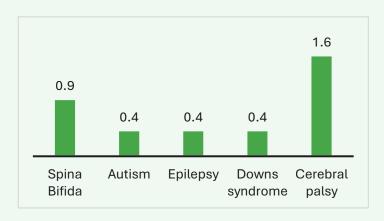

Blindness and low vision conditions increase with increase in age. Blindness peaks at one
percent for persons aged 70 years and above and low vision peaks at 12 percent for persons
aged 80 to 84 years (Table 15.5).

15.6 Neurological disorders

These are conditions that target how the nervous system (brain, spinal cord and nerves) functions. Information was collected on neurological conditions of household members, including spina bifida, epilepsy, autism, cerebral palsy, and Down syndrome.

The most common neurological disorder was Cerebral palsy (2%), followed by Spina bifida (1%) (**Figure 15.3 and Table 15.6**).

Figure 15.3: Proportion of population aged 2 years and above with neurological disorders

15.7 Mental health conditions

Mental health is a state of well-being that allows individuals to cope with life's challenges, realize their potential, learn and work well, and contribute to their community. This encompasses emotional, psychological and social aspects of an individual's life. Mental health is a human rights issue. It is more than the absence of a mental disorder, exists in complex continuum and is experienced differently from one person to another.

Mental health conditions (mental health disorder or psychological distress). This is a psychiatric condition characterized by significant disturbances in cognition, emotion, or behavior, leading to distress or disability in important areas of life such as socializing, work, or self-care.

Probable anxiety disorder: The likelihood of someone being anxious i.e., normally feels worried, nervous or anxious.

Probable depressive disorder: Losing interest in pleasurable activities and low feelings, sadness and stress

Probable psychosis: Seeing things that others don't see or hearing voices that others don't hear

Probable bipolar affective disorder: Having extreme emotions and mood swings

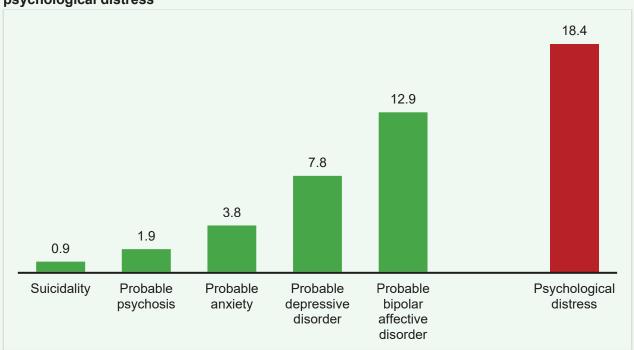

Suicidality: The experience of suicidal plans, thoughts or attempts

Eligibility: Population aged 10 years and above.

The information collected on mental health experiences of individuals included; anxiety, sadness, suicidal tendencies, hearing voices that others don't hear and extreme mood swings. The information was used to measure probable mental health disorders (phycological distress) in an individual.

- The results in Figure 15.4 show that 18 percent of the population aged 10 years and above had experienced psychological distress.
- The most prevalent condition of psychological distress was probable bipolar affective disorder (13%) followed by probable depressive disorder (8%). Suicidality was the least prevalent condition of psychological distress (1%).

Figure 15.4: Proportion of the population aged 10 years and above who experienced psychological distress

Patterns:

Psychological distress increased with age peaking at 34 percent for persons aged 80 to 84 years. The respective conditions of probable depression, anxiety, psychosis, bipolar affective disorder and suicidality followed the same pattern (Table 15.3)

CHILDREN

Key Findings

• Children (0-17): 17% increase in the number of children from 18.9 million in 2014 to 22.2 million in 2024

- **Orphanhood:** 13% of children lost either one or both of their parents
- **First year of Primary:** 60% of 6-year-old children in Uganda had not started their first year of primary of which Karamoja sub-region had the highest with 82%
- Birth Certification: 63% of children under 5 years didn't have a birth certificate
- Open defecation: Six in every ten (60%) households with Children in Karamoja were practicing open defecation
- Child activity: 51% of children aged 14-17 in Karamoja sub-region were out of school and not working

ccording to UNICEF, a **child** is defined as any human being below the age of **18 years** and this aligns with the definition by the **United Nations Convention on the Rights of the Child (CRC)** which considers anyone under the age of 18 as a child. Data on children is required to monitor indicators of SDGs and other development programs. This section examines the distribution and share of children aged 0 to 17 years among the population, their birth registration, distribution of children living in private households by their survivorship; and living with their biological parents and the housing conditions in which they live. The data is examined in respect of the children's age, sex, sub-regions, and district.

16.1 CHILDREN POPULATION DISTRIBUTION

The population distribution of children aged 0 to 17 years is a vital demographic category that frequently covers infancy to adolescence and represents the future workforce and societal basis. The 2024 NPHC census obtained information to offer an in-depth understanding into the number, distribution, and characteristics of children, which is critical for planning in education, health, and social services.

In summary, census data on children aged 0-17 gives a comprehensive understanding of this demographic group, focusing on age subgroups, regional and gender distribution, school enrolments, vulnerability, and housing conditions. This information is critical for policymakers to create and execute successful programs in education, healthcare, and social services, ensuring that the needs of this important part of society are satisfied.

Figure 16.1 Number of Children and proportion of Children to total Population, 2014- 2024

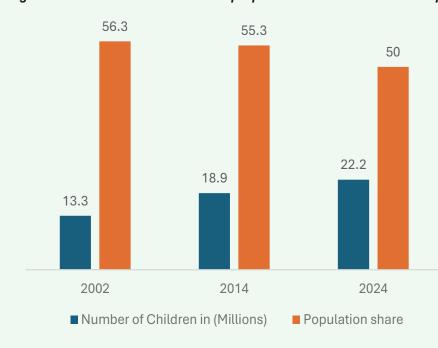

Figure 16.1 indicates an increase (17%) in the number of children (0-17 years) from 18.9 million in 2014 to 22.2 million in 2024. However, a reduction in the population share of children to the total population was noticed from 55.3% in 2014 to 50% 2024.

Figure 16.2 Population share of children age groups

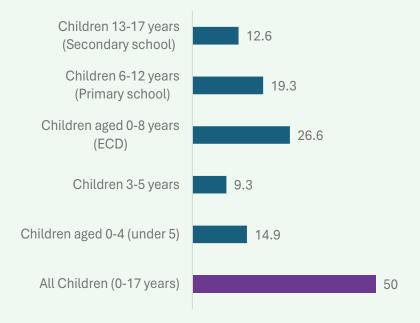

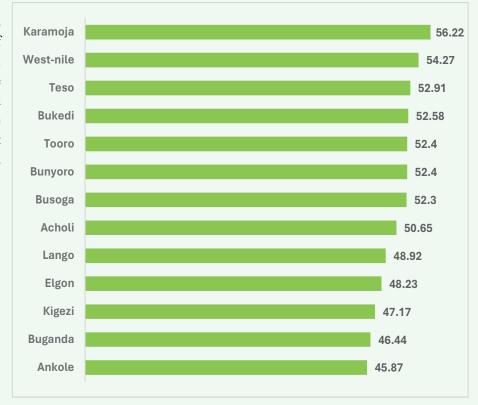

Figure 16.2 indicates that half (50%) of the Ugandan population was comprised of children below 18 years, (15%) were under the age of five, (9%) were in the preschool category age group of (3-5 years), (19%) are in primary school age group, and (12%) were in secondary level schooling category

Figure 16.3: Share of Children (0-17) by Sub-region Population

Results in Figure 16.3 depict a slight difference in share of children at the sub-regional level, Karamoja (56%) had the largest proportion of children to its overall population while Ankole (46%) had the lowest share of children, implying a 10% difference.

16.2 CHILDREN AT RISK OF NOT REALIZING SOME OF THEIR RIGHTS

Children are sometimes denied some of their rights due to a range of factors, including poverty, conflict, discrimination, and lack of access to essential services like education and health services. These risks can prevent children from enjoying fundamental rights such as education, health care, protection from abuse, and participation in society. The 2024 NPHC evaluated children's rights based on the following criteria: children with access to a registered birth certificate, children orphanhood status (lost either one or both of their parents), access to primary and secondary education, marital status of children aged 12-17, and children who have ever given birth between the ages of 12 and 17 years.

The goal of monitoring children's rights is to provide an enabling environment for safeguarding vulnerable populations, guaranteeing fair access to services such as education, urging policy reforms, and promoting national development. It provides an important role in protecting children's rights and encouraging social and economic prosperity in the country.

CHILDBIRTH CERTIFICATION

In Uganda, birth registration and certification are governed by the Registration of Persons Act, 2015, which provides the legal framework for registering births, deaths, and other vital events. The registering of births and issuing birth certificate is coordinated by the National Identification and Registration Authority (NIRA) put emphasis on registering births within **90 days** from the date of birth.

The possession of a birth certificate is the earliest formal recognition of a child's existence and citizenship on a country. Birth certification is a critical legal document for children aged 0-17 years as it serves several important functions that impact their rights, access to services, and future opportunities and these include: child's nationality, school enrollment and access to health services.

Figure 16.4: Proportion of under one and under five children possessing birth certificates

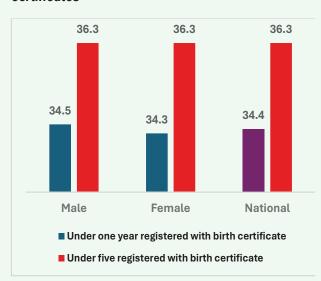

Figure 16.4 shows no slight sex variation among children that possessed birth certificates with under one (34%) and those under five (36%). More female children (36%) under-five the age of five possessed birth certificate compared to those under one (34%)

Figure 16.5: Under five Children registered with birth certificate by sub-region

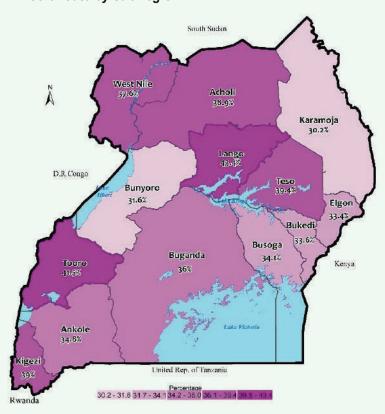

Figure 16.5 reveals that the subregions of Lango (43%) and Tooro (42%) had the highest proportion of under five children with birth certificates while Karamoja sub-region registered the lowest number at (30%). (see Table 16.3)

16.3: ORPHANED CHILDREN

Orphanhood is defined as a child under the age of 18 who has lost one or both parents. UNICEF often classified orphanhood into the following groups. Maternal Orphan: A child who has lost their mother but whose father is still alive. Paternal Orphan: A child who has lost their father but whose mother is still alive. Double Orphan: A child who has lost both parents (mother and father).

Orphanhood status was captured in census to assess the social, economic, and demographic impacts affecting Children at the household level. The 2024 NPHC collected orphanhood statistics to help policymakers make choices about child welfare, social support systems, and the needs of vulnerable groups. This information will be used to design interventions for orphans, notably in education, healthcare, and social protection.

The results shown in Figure 16.6 indicate that 13 percent children are orphaned, those who lost one or both of their parents. Of these, 3% are maternal orphans, 6% are paternal orphans.

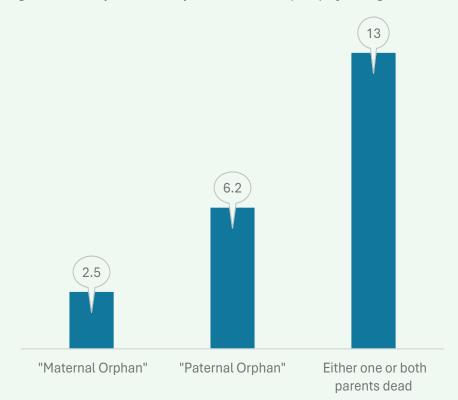

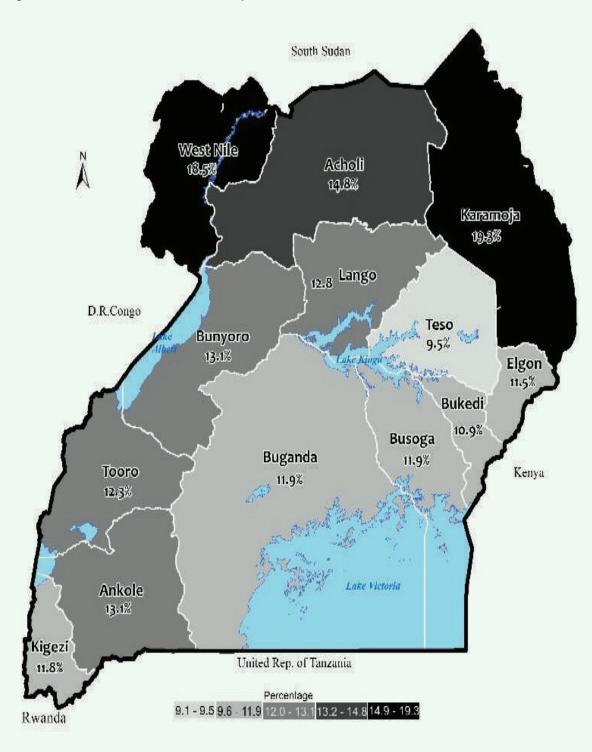

Figure 16.6: Proportion of Orphaned Children (0-17) by background Characteristics

Figure 6.7 shows that the sub-regions of Karamoja (19%), West-Nile (19%), had the highest percentage of children who lost one or both of their parents while Teso had the lowest with (10%).

Figure 16.7: Children with one or both parents dead

16.4 MARRIAGE AND CHILD BEARING

16.4.1 Early childbearing refers to the phenomenon where individuals usually the girl children, give birth before reaching adulthood (18 years). This is closely associated with early marriage but can also occur outside of marriage due to various social and economic factors. UNICEF defines early childbearing as the occurrence of childbirth before the age of 18. It mainly refers to pregnancies and births among the girl child, often caused by early marriage, lack of access to reproductive health care, and inadequate education, resulting in higher maternal and infant mortality rates, continuing vicious cycles of poverty.

Targeting early childbirth and lowering the worldwide rate of maternal mortality to less than 70 per 100,000 live births, **SDG 3.1** is a significant initiative. Early deliveries in children considerably increase the risk of maternal mortality and morbidity. The Children Act (Cap 59), as Amended 2016 protects the rights of children in Uganda. It sets the legal age of consent for marriage at 18 years and includes provisions aimed at protecting children from exploitation, neglect, and early marriages, which often lead to early childbirth.

16.4.2 Child Marriage

UNICEF defines child marriage as any official or informal union in which at least one of the participants is under the age of 18. This practice, impacts more girls compared to boys, is considered a violation of human rights. Child marriage frequently leads to early pregnancy, social isolation, less educational and employment possibilities, and an increased risk of domestic violence. SDG Target **5.3** monitors child marriages and aims to eliminate all harmful practices, like early and forced marriage, and female genital mutilation (FGM) to achieve gender equality and ensuring girls have equal opportunities in education, health, and economic participation.

Figure 16.8 Proportion of Children aged (12-17) who are currently/ever been married

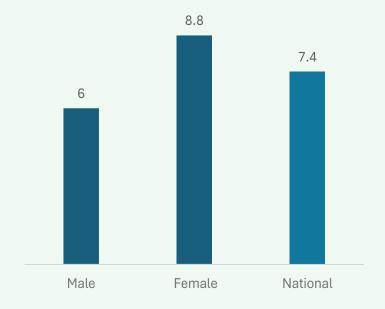

Figure 16.8 indicates a slight decline in children aged (12-17) that were currently/ever been married from (9%) in 2014 to (7%) in 2024. More female children (9%) were or a currently married as compared to the male children (6%) between the age of 12 and 17 years

The sub-region of Karamoja (12%) had the highest prevalence of children who were currently or had ever been married followed by Lango (8%) West-Nile, Acholi, Bunyoro and Elgon at (7%) respectively.

South Sudan West Nile Acholi 7.2% 7.1% Karamoja 12.2% Lango D.R. Congo Teso 5.7% Bunyoro 7.0% 7.2% Elgon Bukedi Busoga 6.7% 6.6% Buganda Kenya Tooro 4.9% 6.0% L. Edward Ankole 5.3% Kigezi 6.3% United Republic of Tanzania Percentage 6.1 - 8.0 8.1 - 10.0 > 12.0 Open Water 4.0 - 6.0 Rwanda

Figure 16.9 Proportion of Children aged (12-17) who are currently/ever been married by Sub-regions

16.5 CHILDREN SCHOOLING AND THEIR EMPLOYMENT STATUS

The Children Act (Cap 59), as amended by the Children (Amendment) Act 2016: provides a comprehensive legal framework for the protection and promotion of children's rights in Uganda, aligning with international conventions like the UN Convention on the Rights of the Child. The Act emphasizes the right of every child to education and places responsibilities on parents and the state to ensure children attend school and receive proper care and guidance.

In addition, Uganda's alignment with Sustainable Development Goal (SDG) 4 emphasizes ensuring inclusive and equitable quality education for all, including girls, vulnerable children, and persons with disabilities. Uganda also strives to eliminate gender disparities in education by 2030, ensuring equal access to all levels of education and vocational training (UNICEF, EPRC, UN in Uganda)

The 2024 NPHC collected information on the age at which children start their first year of primary school, children accessing pre-school "baby class till top class," the proportion of children not attending primary school between the age of 6-12 years, children not attending ordinary level education beginning at the age of 13 to 17 years, children who did not complete primary school on time (13 years), and those who did not complete ordinary secondary school by the age of 17.

Figure 16.10 Percentage of children not in school by age 6

Figure 16.10 shows that 60% of children were not in their first year of primary school by the age of six. A bigger variation was shown among children in urban areas (54%) as compared to those in rural (63%). More male children (62%) to females (58%) were not in primary one at the age of six.

Figure 16.11 Children of primary school going age that were out of school

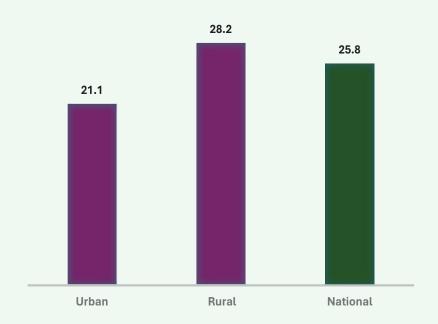

Figure 16.11 shows that (26%) of children were out of school at the age (6-12). A significant difference was indicated among children living in rural areas (28%) to those in the urban centers (21%) who were out of primary school between the age of (6-12) *Table 16.5*.

16.12 Children of secondary school going age that were out of school

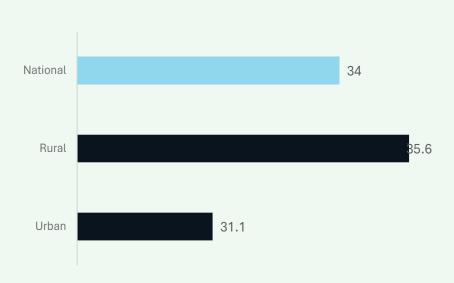

Figure 16.12 shows that (34%) of children were out of school at the age (13-17). More children living in rural areas (36%) compared to those in the urban residences (31%) were out of secondary school between the age of (13-17)

Figure:16.13 Primary school going age persons Out of school by Sub-region

Figure 16.13 indicates Karamoja (75%) had the highest proportion of children who were out of primary school between the ages of (6-12), this was followed by West-Nile (34%) and Acholi (30%) with children aged (6-12) out of school. Kigezi subregion (19%) had the lowest percentage of children aged 6-12 who were out of school

16.14 Children Secondary schooling Status by Subregion

Figure 16.14 reveals Karamoja sub-region (72%), Bunyoro (40%), West-Nile (38%) and Lango (38%) had the highest percentage of children who were out of secondary school between the age of (13-17) while the sub-regions of Teso (27%) and Elgon (27%) had the lowest percentage of children aged 13-17 who were out of school.

Figure 16.15 Activity Status of Children

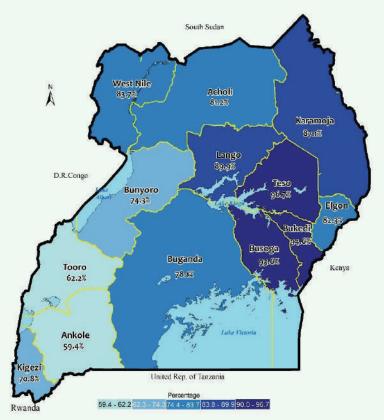

Figure 16.15 shows that (27%) of a children aged 14-17 years were out of school and were not in employment. Karamoja subregion (51%) had the highest proportion of children who were out of school and were not working while Kigezi (20%) had the lowest proportion of children out of and school and were not working between the age of (14-17) (see *table 16.5*).

16.6 CHILDREN LIVING CONDITIONS

Children's living conditions, particularly in terms of housing, are critical indicators of their well-being and development. The 2024 NPHC collected information providing a comprehensive picture of the key aspects like child headed households, lighting source, distance to water sources and toilet facilities in relation to children housing condition. The Sustainable Development Goal (SDG 6) is directly related to Water, Sanitation, and Hygiene (WASH), ensuring availability and sustainable management of water and sanitation for **all children and SDG 7** focusing on ensuring access to affordable, reliable, sustainable, and modern energy for children in their respective households.

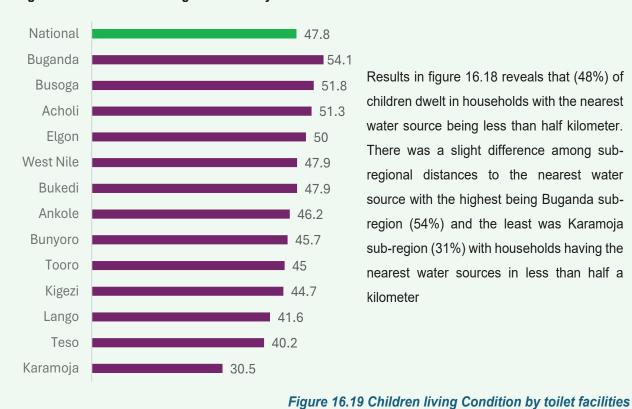

Results from figure 16.16 indicates Teso subregion (97%) has the highest percentage of children living in households with improved water sources while Ankole sub-region (59%) had the lowest percentage of children living in households with improved water sources like (tap water, borehole, protected wells and springs), **see table 16.6**.

Figure 16.17 Child living conditions by "source of Lighting"

16.17 indicates Figure the Karamoja sub-region had the highest proportion (60%) of children who were living households using unclean energy like gasoline, paraffin or candle for lighting while Buganda sub-region had the least proportion of children living in households using unclean energy for lighting at (14%)

Figure 16.18 Children Living Condition by access "distance" to water sources

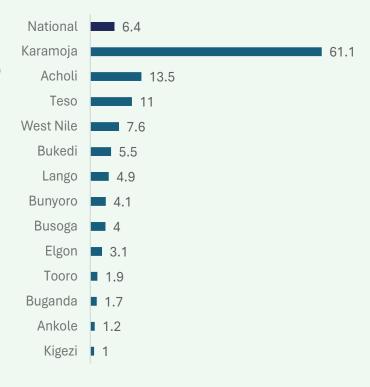

Results in figure 16.18 reveals that (48%) of children dwelt in households with the nearest water source being less than half kilometer. There was a slight difference among subregional distances to the nearest water source with the highest being Buganda subregion (54%) and the least was Karamoja sub-region (31%) with households having the nearest water sources in less than half a kilometer

Figure 16.19 shows that Buganda sub-region (62%) had the highest proportion of children living in households with improved toilet facilities like "VIP latrine with a slab, flash toilets" but these must not be shared with other households while only (12%) of children in Karamoja subregion were living in household with improved toilet facilities, see figure 16.6.

South Sudan West Nile A Acholi 29.8% Karamoja Lango 26.5% D.R.Congo Teso Bunyoro Elgon Bukedi Busoga Buganda Kenya Ankole Kigezi United Rep. of Tanzania Percentage 12.0 12.1 - 26.7 26.8 - 32.0 32.1 - 39.6 39.7 - 61.9 Rwanda

Figure 16.20 Children living Condition by toilet facilities "Open defecation"

Figure 16.20 indicates that (6%) of children were living in households practicing open defecation with Karamoja sub-region (61%) having the highest percentage of children living in households practicing open defecation followed by the sub-regions of Acholi (14%) and Teso (11%).

For more information about children see the following tables:

YOUTH AND ADOLESCENTS

Key Findings

- Proportion of youths and adolescents to the total population: 22.5% and 24.9 % of the population are youth (18-30 years) and adolescents (10-19 years) respectively.
- Literacy among the youth and adolescents: Literacy was 82.3% among the youth and 76% among the Adolescents.
- Household headship: 29 % of the household heads were youth and 3% adolescents.
- Average Household size: On average youth headed households had 3 members while adolescent household headed ones were 2.
- Beneficiaries of government programmes. 12% of the youth benefitted from government programmes. Less than one percent benefitted from Youth Livelihood programme.
- SDG 3.7.2: Adolescent birth rate aged 10-19 years (10-14 years; 15-19 years) per 1000 women in that age group. 31 women per 1000 women aged 10-19 years give birth annually. The rate is much higher among women aged 15-19 years at 61 women per 1000 compared to one woman per 1000 among those aged 10-14 years.

oung people are central to the demographic dividend and remain players in and advocates of social transformation and development in many spheres. The enormous contribution of the young people towards social economic transformation can be realized when their rights are protected and investments made in their education, employment, health, empowerment and civil participation. The NPHC 2024 considered the youth as persons aged 18-30 years (National Youth Policy, 2015) and the adolescents as persons aged 10-19 years (National Youth Council Act, 2015). However, internationally the youth are persons aged 15-24 years and 15-35 years for East Africa. The chapter therefore, presents findings for the youths and adolescents in Uganda for the specific age groups.

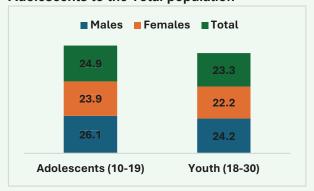

17.1. Population distribution and size of the youth and adolescent persons 17.1.1 Distribution of the Youth and Adolescents by Sex

Information was collected on age and sex of the population that were present in Uganda on the Census night.

The youth (18-30) consist of 23 percent of the total population while the adolescents (10-19) consist 25 percent (**Table 17.1**).

Among adolescents, the proportion was higher for males (26%) than their female counter parts (24%). Among the youth, there were more males (24%) than females (22%).

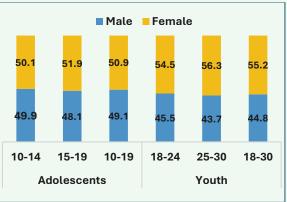

Figure 17. 1: Proportion of the Youth and Adolescents to the Total population

17.1.2 Distribution of the youth and adolescents by age group

Information shown in Figure 17.2 indicates that overall, males were more than females across all age groups. Among the youth aged 18-30 years, the females (55%) were more than males (44%). The pattern was the same for adolescents aged 10-19 years with females (51%) slightly higher than males (49%) within the same age group. By sex, there were more females than males across all age group. The proportion of females to total population within the same age group increased males within the same age group increases with an increase in age. It was also observed that, across all age groups, as age increases, the proportion of females increases while that of males decreases.

Figure 17. 2: Distribution of the Youth and Adolescents by Age group

17.1.3 Proportion of the youth and adolescents to population

Over the last three decades, the proportion of adolescents increased from 22 percent in 1991 to 25 percent in 2014 and remained the same at 25 percent in 2024. The proportion of the youth increased from 20 percent in 1991 to 24 percent in 2002, 22 percent in 2014 and has slightly increased to 23 percent in 2024. By subregions, Buganda and Lango had the highest proportion of youth both at (25%) while Kigezi (19%) had the lowest. The highest proportion of adolescents (27%) were in West Nile and least in Karamoja (22%) (**Table 17.1**).

Figure 17. 4: Map Showing Proportion of youth to the total population

Figure 17. 3: Proportion of the Youth and Adolescents to Population from 1991-2024

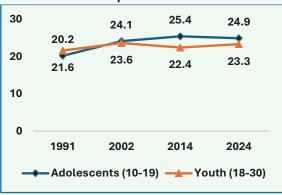

Figure 17. 5: Map Showing Proportion of the Adolescents to the Total population

17.2 Background characteristics

In an effort to improve on quality of its population, Government of Uganda has over the last 2 decades invested highly in educational programs such as the Universal Primary Education (UPE) and Universal Secondary Education (USE) since 1997 and 2007 respectively. To enhance education attainment among those deprived of this social good, the government established equity and equality interventions such as the affirmative action for the to the female students where they are added 1.5 points when joining tertiary levels of learning like the universities.

17.2.1 Status of school attendance of youths and adolescents

The NPHC 2024 collected information on schooling status for all persons aged three years and above. This section, however focusses on the adolescents (10-19 years) and youth (18-30 years).

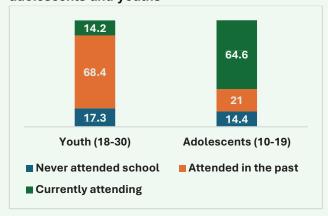

Figure 17.3 below presents information on the schooling status of youths and adolescents by current schooling status. The status includes those who never attended school, those who attended in the past and those currently attending.

Overall, 17 percent of the youth had never attended school. Majority of the youth reported that they attended in the past (68%). There were no differences by sex disaggregation as shown in **Table 17.5**.

On the other hand, 65 percent of the adolescents were currently attending school, 14 percent had never attended school while 21 percent attended in the past. (**Table 17.5**). Disaggregation by subregions, showed that Karamoja had 71 **17.2.2 Education attainment**

percent of the youth and 66% of the adolescents that have never attended school.

Figure 17. 6: School attendance status of adolescents and youths

Household members were asked to report on their highest class/grade of formal education completed. The analysis in Figure 17.4 focuses on the youths and adolescents.

The highest proportion of the youth aged 18 to 30 years had completed some primary (26%) followed by those that completed secondary education (20%) while majority of the adolescents aged 10 to 19 years had completed some primary education (61%).

Overall, 18 percent of the youth and 16 percent of the adolescents had no formal education (**Table 17.4 and Table 17.5**).

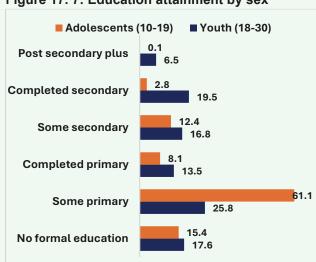

Figure 17. 7: Education attainment by sex

17.2.3 Literacy status of youths and adolescents

Figure 17.5 shows the literacy rates for youths and adolescents. Literacy rate was 82 percent for the youth and 76 percent for adolescents. There was no difference in literacy rates for male and female youths. Among the adolescents, the literacy rate was higher for females (78%) than their male counterparts (73%) (**Table 17.7**).

Disaggregation by region shows that it, literacy among the youth was highest in Buganda (89%) and Lowest in Karamoja (29%). The pattern was the same for adolescents. Literacy among the adolescents was Buganda (88%) and Lowest in Karamoja (29%).

Figure 17. 8: Literacy rate by sex

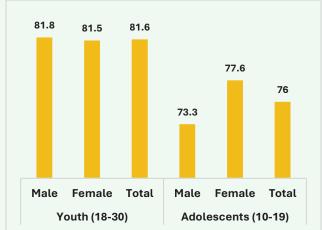

Figure 17.9: Map showing Adolescent literacy

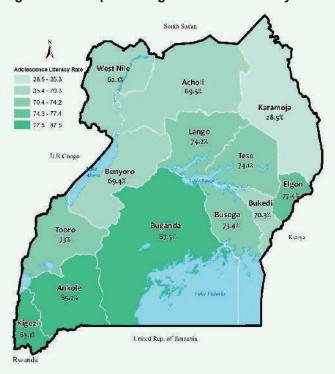

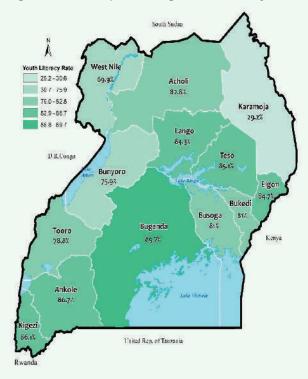

Figure 17.10: Map showing Youth literacy

17.3 Household characteristics

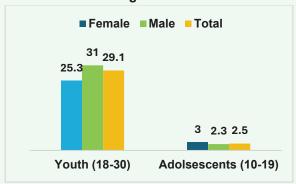

17.3.1 Household headship among the youths and adolescents

During the NPHC 2024, a household head was defined as the person who was regarded by the members of the household as their head.

The results in Figure 17.7 indicate that 29 percent of the household heads were youth (18-30 years) and only three percent adolescents. The results further indicate that the proportion of male youth household heads (31%) was higher than that of their female counterparts (25%). The proportion of adolescent household heads who were female (3%) was higher than that of males (2%) in the same age group

Karamoja had the highest proportion of youth household heads (38%), followed by Bunyoro, Buganda and Acholi at 33% and lowest in Kigezi Sub region (22%) (**Table 17.2**).

Figure 17. 11: Proportion of youth and adolescents heading households

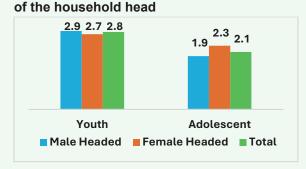

17.3.2 Average Household size of Households Headed by the Youths and Adolescents

On average, households headed by the youth had three members while those headed by adolescents had two members. There was no difference in household sizes irrespective of the sex of the household.

By sub region, West Nile and Karamoja on average had the biggest household sizes (4 persons) headed by the youth and smallest in Buganda sub region (2 persons). The pattern was the same for adolescent headed households with both West Nile and Karamoja sub region having 3 persons per household table

(Table 17.8).
Figure 17. 9: Average household size by sex

17.4 Motherhood among youths and adolescents

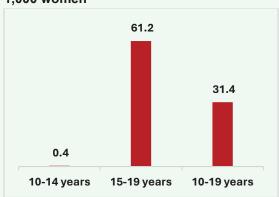

For women, marriage marks the onset of regular exposure to pregnancy. However, teenage pregnancy and motherhood is one of the health and social concerns in Uganda. Teenage pregnancy is associated with high morbidity and mortality for both the mother and the child. When youths and adolescents enter into marriage at an early age (below 20 years), the risks associated with pregnancy and child bearing are quite high. Marriage and child bearing will also disrupt education thus limiting one's future productive potential.

17.4.1 Adolescent birth rate (10-19 years)

SDG Indicator 3.7.2 measures adolescent birth rate (aged 10–14 years; aged 15–19 years) per 1,000 women in that age group. The adolescent birth rate represents the level of childbearing among females in the particular age group

Information was collected on pregnancy and childbearing by women aged 10-19 years. Results in Figure 17.10 indicate that out of every 1000 women aged 10-19 years, 31 give birth annually. Sixty one women aged 15-19 years give birth annually compared to one woman among those aged 10-14 years.

Figure 17. 13: Adolescent birth rate per 1,000 women

17.5: Government programs

In order to address the issue of youth unemployment, the government has set up various interventions some of which are targeted towards the young people such as Emyooga, among others. There were also programs targeted to women such as the Uganda Women Entrepreneurship Program (UWEP).

NPHC 2024 collected information on all persons aged 18 years who benefitted from any government program twelve months preceding the census. This sub section therefore, will focus on the youth aged 18-30 years. The analysis for UWEP focused on only female youth aged 18-30 years.

15.5.1 Beneficiaries of government programs

Figure 17.8 shows the proportion of youth who reported that they benefited from any of the government programs.

Overall, 12 percent of the youths reported that they benefited from any of the government programs.

The highest proportion of youth benefitted from NAADs (10%) followed by PDM (1%). Emyooga program had the least youth beneficiaries with less than one percent

In terms of women targeted program, less than one percent of the female youth benefitted from UWEP. Less than one percent of the youth benefitted from the youth targeted program (YLP)

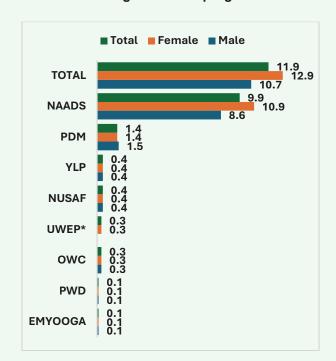

By sub region, the highest proportion of the youth who benefitted from any government programme were in Acholi (22%) followed by Lango and Karamoja both at 17 percent. The least proportion of beneficiaries were in Buganda (8%) and Busoga and Ankole both at 10%.

By education, the highest proportion of beneficiaries, were those who had completed primary and post-secondary education both at 15 percent and least among those with no formal education (7%).

By sex, a slightly higher proportion of women (13%) than males (11%) benefitted from any

government program (Table 17.9).

Figure 17. 10: Proportion of the youth that benefitted from government programs

OLDER PERSONS

Key Findings

- Population of older persons: 5% of the total population were older persons aged 60 years+.
- literacy rate: 46% **of** the older persons are literate
- Average HH size of older persons. On average 4.2 members were in a household headed by an older person.
- Older persons' Living arrangements: 14% of the older persons were living in single person households
- **Beneficiaries of government programs:** 24 percent of the older persons benefited from at least one government program with 19% of the older persons benefitted from SAGE (18%), NAADs (13%) SEGOP (7%) and PDM (6%).
- Source of livelihood for older persons: 72% of the older persons depend on subsistence farming as their main source of livelihood

he national policy for older persons defines older persons as those persons aged 60 years and above (MoGLSD, 2009). There is need to furnish data on older persons to facilitate evidence-based policy development and planning. Up to date data on older persons will enable the Government and other stakeholders to adequately plan for them so that they enjoy dignified life and actively participate in economic, social, cultural and political life in their communities.

Several older persons in Uganda are making important contributions as leaders in politics and businesses, and in their communities. The traditional role of an older person is understood as sharing knowledge, advice and wealth, mediating domestic conflicts, and guiding and caring for grandchildren. There is need to know where the older persons are and where they access services from to support them. This chapter, therefore, brings forth the situation of older persons in Uganda by demographic characteristics.

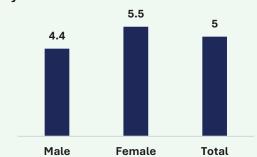

18.1 Population distribution and size of the older persons

18.1.1 Distribution of Older Persons by Sex

Findings from the NPHC 2024 indicate that the proportion of older persons to the total population was 5 percent. The proportion was higher among the females (5%) than their male counter parts (4%). (Table 18.1).

By sub region, disaggregation, Kigezi (7%) had the highest proportion of older persons followed by Ankole and Elgon both at 6% and lowest in Karamoja sub region (4%) (**Table 18.1**).

Figure 18. 1: Distribution of Older Persons by Sex

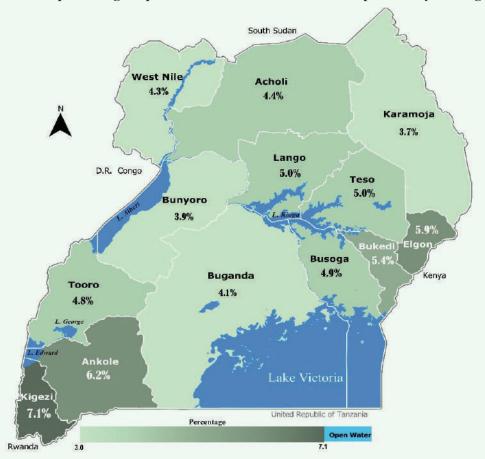

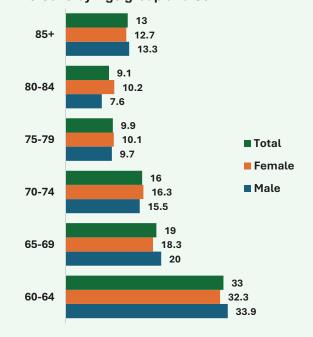

Figure 18. 2: Map Showing Proportion of Older Persons to Total Population by Sub region

18.1.2 Distribution of Older Persons by Age Groups

Information shown in Figure 18.2 indicates that most older persons were within the age group of 60-64 years. The proportion however reduces with an increase in age. The age group of 80-84 had the lowest proportion of older persons. The proportion of males is higher than females in the age group of "60-64" and "65-69" years compared to other age groups.

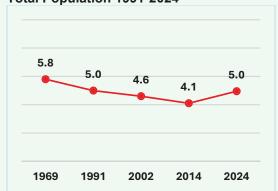

Figure 18. 3: Percentage Distribution of Older Persons by Age group and Sex

18.1.3 Proportion of Older Persons from 1991-2024

Figure 18.4 presents the trend of the proportions of older persons to total population. Findings from the NPHC 2024 indicated that there was a decline of the proportion of older persons from 6 % in 1969 to 4% in 2014. Over the last decade, the proportion of older persons has increased from 4 % to 5% in 2024 (**Table 18.1**)

Figure 18. 4: Proportion of Older Persons to Total Population 1991-2024

18.2 Background Characteristics

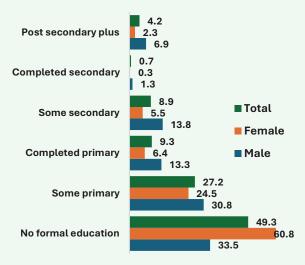

18.2.1 Education attainment of the older persons

The NPHC 2024 collected information on highest grade / class completed by any member in the household.

Figure 18.4 shows that overall, 49 percent of the older persons had no formal education. Disaggregation by sex, shows that 61 percent of the female older persons had no formal education compared to their male counterparts (34%).

A higher proportion of male older persons had completed primary and above compared to the women.

Figure 18. 5: Highest Level of Education among older persons

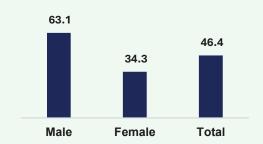

18.2.2 Literacy

The NPHC 2024 collected information on a person's ability to read and write with understanding in any language.

Findings in Figure 18.5 indicate that, overall, the literacy rate of older persons was 46 percent. The rate was higher among the males (63%) and lowest among the females at 34 percent. This implies that more than half of the older persons were not able to read and write with understanding in any language.

Figure 18. 6: Literacy Rate among older persons

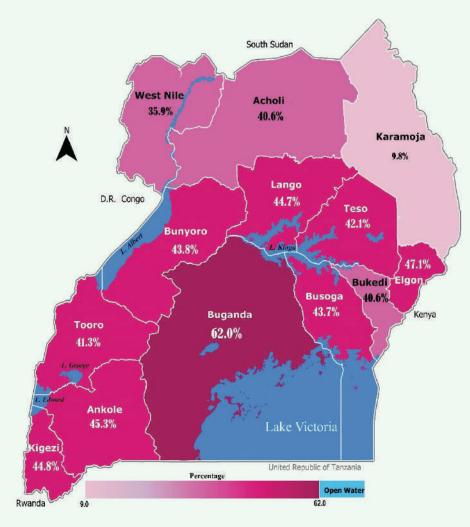

Figure 18. 7: Map showing literacy rates of the older persons by sub region

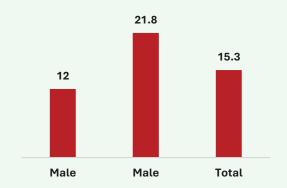

18.3 Household characteristics

18.3.1 Distribution of households headed by older persons

The NPHC 2024 enumerated 10.5 million households and of these 15 percent were headed by older persons, majority of whom were female (22%). Kigezi sub region had the highest proportion of older persons headed households followed by Bukedi (19%), Elgon (19%), Ankole (19%) while Buganda (12%) had the least. The highest proportion of the older persons headed households had no formal education (28%) and this was higher among females (38%) compared to males

(20%) (Table 18.3).

Figure 18. 8: Proportion of Older persons headed households to Total Households

18.3.2 Average household size of households headed by older persons

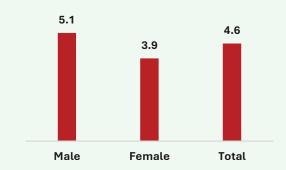

The NPHC 2024 collected information on all persons that were present in the household on the census night.

On average, households headed by older persons had four members.

Households headed by male older persons on average had more members (5 persons) compared to those headed by females (4 persons).

On average, West Nile Sub region had the highest household size (4.8) followed by Karamoja (4.6) while Kigezi Sub region had the smallest household size (3.6).

Figure 18. 9: Average Household Size for households headed by older persons by sex of household head

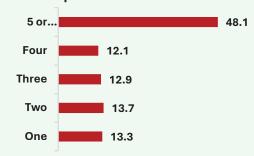

18.3.3 Living arrangements

Advanced age is associated with ageing challenges that require care. Household size can work as a proxy for measuring care and living arrangements for old persons. This sub section presents the household population by the sex of the household head. Only household heads who are older persons were considered for this section.

Figure 18.9 shows that 14 percent of the older persons were staying in single person households. This proportion was more than double of those headed by non-older persons.

The majority of the older persons (48%) were staying in households with five household members and above.

Figure 18. 10: Distribution of households headed by the older persons by the average number of persons in the Household

18.3.4 Source of Livelihood

The economic potential of older persons in Uganda is limited, as majority of them are illiterate and many more have poor health conditions and a great percentage have functional limitations. The majority are therefore reliant on subsistence agriculture, and yet this is labour intensive with very low economic returns.

Findings in Figure 18.10 show that 72 percent of the older persons depended on subsistence farming as a source of livelihood. This was followed by support from friends and relatives at five percent (**Table 18.9**).

Figure 18. 11: Main Source of Livelihood for Households headed by older persons (%)

18.4 Access to government programs

18.4.1 Proportion of older persons that have benefited from Government Programmes

The Government of Uganda has initiated programs to enable socio-economic transformation of the citizens. The NPHC 2024 collected information from all the persons aged 18 years and above who had ever benefited from the different government programs, however this section only looks at persons 60 years and above. Social Assistance Grant for the Elderly (SAGE) was collected for persons 80 years and above.

Figure 18.11 shows the proportion of older persons who reported that they benefited from any of the government programs in the last twelve months preceding the census.

Overall, 24 percent of the older persons reported that they benefited from any of the government programs.

The highest proportion of older persons was among those who benefitted from SAGE (18%), NAADs (13%) and SEGOP (7%). Emyooga program had the least old person beneficiaries with less than one percent.

Disaggregation by sex show that the proportion of female older persons who had benefitted from any government programme (24%) was slightly higher than that of males (23%) (**Table 18.10**).

Figure 18. 12: Proportion of Older Persons Who Benefited from Any of the Government Programmes

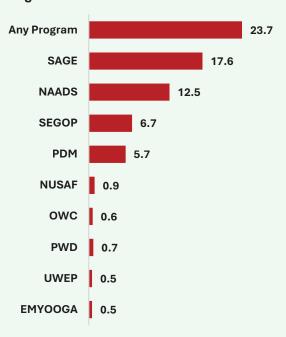

Figure 18. 13: Map Showing percentage distribution of older persons that benefited from any government programme

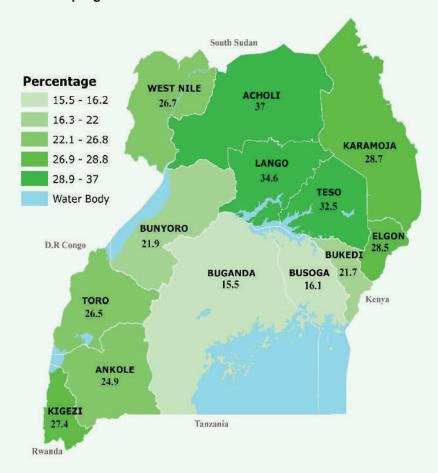

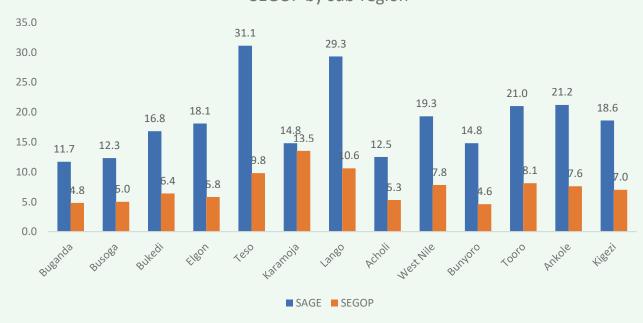

Figure 18.14: Percentage of older persons benefiting from SAGE or SEGOP by sub-region

Agriculture

Key Findings

- Agriculture Households: 62 percent of households in Uganda were found to be agriculture households.
- Crop growing: Constituted 61 percent of all households.
- Livestock keeping Constituted 37 percent of all households
- Purpose for agricultural Activity: Majority 53 percent of agricultural households undertook the activity mainly for home consumption and 17 percent mainly for sale.
- **Irrigation:** Four (4) percent of agricultural household were engaged in irrigation.
- Water for production: 98 percent of the parishes utilize rainwater for agricultural production.
- **Challenges:** 96 percent of the parishes reported crop diseases as a challenge to crop production and 94 percent reported animal theft as a challenge to animal production.
- **Marketing:** 97 percent of the parishes reported bad roads and 94 percent reported lack of means of transport to marketing agricultural produce.

griculture is the practice of growing crops including tree crops, and raising livestock for food, fiber, and other products used to sustain and enhance human life.

The Third National Development Plan identified the agro-industrialization program with a goal of increasing commercialization and competitiveness of agricultural production and agro-processing. Therefore, the census results on the agricultural sector will be a key ingredient in the monitoring of the NDP III performance, informing decision-making and policy formulation. (NPA, 2020).

19.1 Households engaged in agriculture

This section presents the percentage of households in Uganda that were engaged in agricultural activities. For the purpose of the census, the term agriculture excluded: ornamental gardening, capture fisheries, hunting, extractive activities, and agro-processing.

Households were asked if they undertook crop production, livestock keeping and aquaculture production. Any household that had any one of the practices was considered to engage in agriculture.

Results show that 62 percent of households in Uganda were engaged in agriculture compared to about 80 percent reported in 2014 Census.

Households engaged in crop growing were 61 percent compared to 75 percent reported in census 2014. In addition, 37 percent of the households were engaged in livestock keeping compared to 58 percent in the 2014 census.

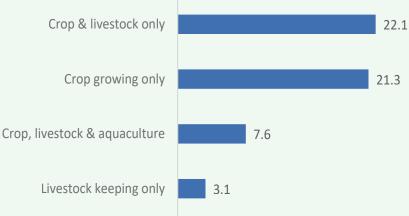

36.7

Figure 19.1 Distribution of Agricultural Households (%)

Livestock Keeping Crop Production Agricultural household

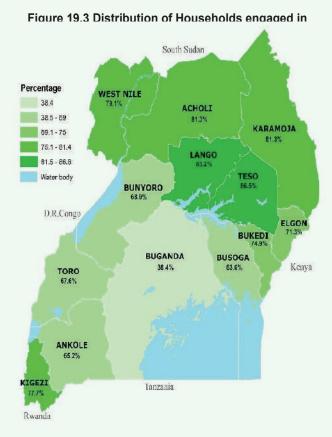

The results revealed that there were more households engaged in crop and livestock (22 %), followed by those engaged in crop growing only (21%). While those keeping livestock were three percent.

Figure 19.2 Distribution of Households by Farming enterprises

Patterns by Background Characteristics

The results further showed that the Teso subregion had the highest percentage of households engaged in agricultural production (87%), followed by Lango (83%) and Karamoja and Acholi (at 81%). Buganda had the lowest percentage of households engaged in agriculture (38%). **Table 19.1**

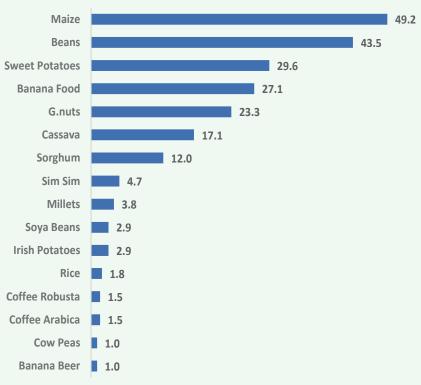

19.2 Crops grown

Data was collected on crops grown by the household in order of importance. This section presents the crops commonly grown by agricultural households.

Maize was the most commonly grown crop by about 49 percent of the households, followed by beans (44%), Sweet potatoes (30%), and Banana food/matooke (27%).

Figure 19.4 Distribution of Households by Commonly grown crops (%)

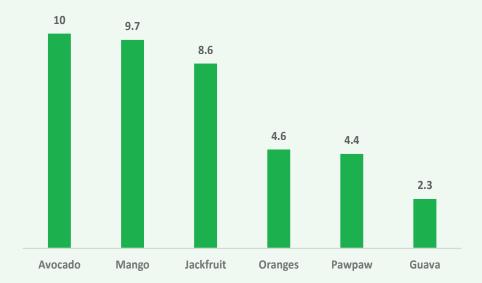

Patterns by background characteristics

- Among the three commonly grown crops, Maize was mainly grown by households in Lango (73%) followed by Acholi (68%) subregion.
- The sub-region with the highest percentage of households growing beans was Kigezi (69%), followed by Elgon (60%) and Bunyoro with 58 percent.
- The sub-region with the highest percentage of households growing banana Food (Matooke) was Elgon (51%), followed by Ankole (49%) and Tooro at 44 percent. For more information on crops grown see **Table 19.6**.

19.3 Tree crop growing

Tree crop growing refers to the cultivation of tree-based crops such as mangoes and avocados.

- Avocado and Mango were the most Figure 19.5 Distribution of tree growing households (%)
 - grown tree crops each by 10 percent of the households, followed by households growing Jackfruit at nine (9) percent.
- Households growing Oranges were five percent and Pawpaws four (4) percent, and two (2) percent for households growing Guava. (Table 19.5).

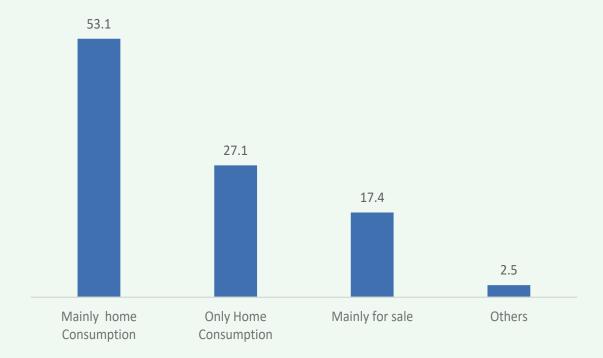

19.4 Main purpose for agricultural activity

Main Purpose for agricultural activity.

This defines the primary reason a household engages in agriculture.

The results revealed that the highest percentage of agricultural households (53%) undertook agricultural production mainly for home consumption and 27 percent for only home consumption.

Figure 19.6 Distribution of Agricultural households by Main purpose of agricultural activity (%)

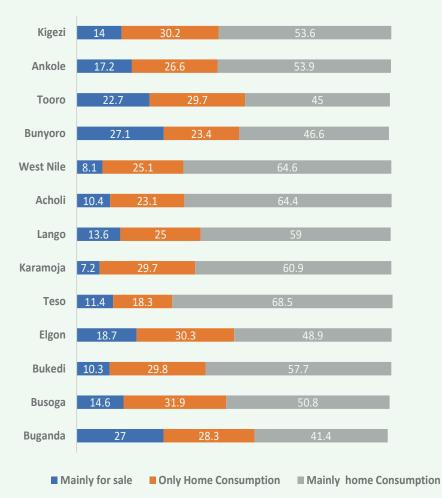

Patterns by background characteristics

- Bunyoro and Buganda Sub regions (both at 27%) reported the highest percentage of agricultural households undertaking the activity mainly for sale while Karamoja (7%) reported the least.
- Regarding producing for only home consumption, Busoga had the highest percentage (32%), followed by Kigezi, Elgon, Tooro, Karamoja, and Bukedi had (30%).
- sub-region Teso had the highest percentage of agriculture households producing mainly for home consumption with (69%),followed by West Nile and Acholi each with 65% while Buganda had the least with (41%).

(Table 19.3).

Figure 19.7 Distribution of Agriculture Households by Purpose of Agricultural Activity within sub-region (%)

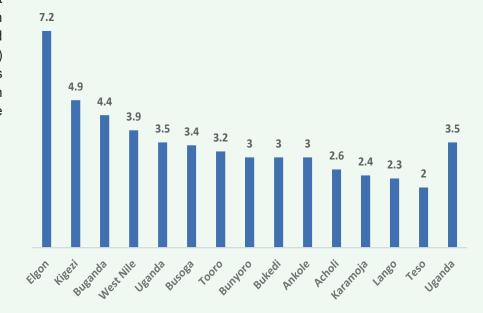

19.5 Households engaged in Irrigation

Irrigation refers to purposely providing land with water, other than rain, for improving pastures or crop production. Irrigation usually implies the existence of infrastructure and equipment for applying water to crops, such as irrigating canals, pumps, sprinklers, or localized watering systems. However, it also includes manual watering of plants using buckets, watering cans or other devices. Uncontrolled land flooding by overflowing rivers or streams is not considered as irrigation.

Data was collected on households that irrigated crops. Nationally about four (4) percent were engaged in irrigation compared to Six (6) percent in the 2014 Census.

The sub-region with the percentage of households that irrigated their crops was Elgon at seven (7) percent, followed by Kigezi at about Five (5) percent while the least was found in the Teso sub-region with only two (2) percent of the Households.

19.6 Water for Agricultural Production

Water for agricultural production refers to the development and utilization of water resources for the purpose of crop and livestock production, aquaculture, and other agricultural practices to increase and sustain agricultural productivity and thus economic growth.

Results on sources of water for agricultural production in the communities have been presented to show the percentage of parishes that reported to have a type of water source.

Figure 19.9 Distribution of Parishes by Source of water for agricultural production

As shown in Figure 19.9, (98%) of the parishes depended on direct rain in season as the most used water source for agricultural production, by boreholes (66%), and wetlands (54%). **Table 19.10**

19.7 Common Challenges of Crop Production in the communities

Data was collected on the common challenges to agriculture production encountered by households at the community level i.e. a parish. This will inform the NDP III framework so as to streamline and direct government investments towards increased agricultural production, agro-processing, and realization of the sector's full potential.

Commonly reported challenges to crop production among communities included Crop diseases, lack of improved or certified seed, insufficient Agricultural land, and Theft of crops among others. The results revealed that 96 percent of the parishes in Uganda were challenged by crop diseases, 95 percent had inadequate access to improved or certified seeds 95 percent had insufficient agricultural land, 93 percent reported theft of crops while Insufficient rain was reported by (90 percent) of the Parishes. **Table 19.7**

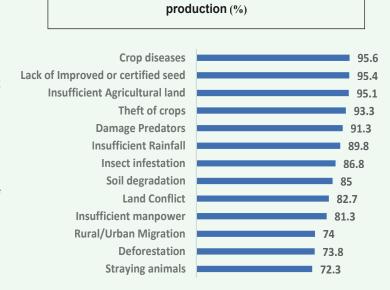

Fig 19.10 Parishes reporting challenges of crop (%)

19.8 Livestock- Keeping

Livestock-keeping Households

Livestock keeping households are those that keep cattle, goats, sheep, pigs, chicken as part of their livestock farming activities. Information was collected on households keeping livestock within Parishes.

The Census revealed that the highest percentage of Households Kept Chicken (79%) followed by Goats (53%), 36 percent kept cattle, 30 percent kept Pigs and fifteen (15) % kept sheep.

78.6 53.1 36.7 36.2 29.7 14.5 12.6 Chicken Cattle **Pigs** Other Livestock Goats Sheep Keeping **Poultry** Households

Figure 19.11 Livestock- Keeping Households (%)

Patterns by background characteristics

- Disaggregation by subregions shows that Acholi and Lango had the highest percentage of chickenkeeping households within their parish (each at 87%), followed by Bukedi (83%), while Kigezi had the lowest with 51 percent.
- For goat keeping, the highest percentage of households keeping goats was found in West Nile at 68 percent, followed by Karamoja (66%), and Ankole & Teso (each at 59%).
- For cattle keeping, the highest percentage of households keeping cattle was found in Karamoja at 68 percent, followed by Elgon (61%), and Teso (56%) **Table 19.4.**

19.9 Common Challenges of Livestock Production in communities

- Data was collected on the common challenges to Livestock Production which are faced by the communities. These were broadly categorized as pests of animals, epizooties (widespread diseases in animals), theft of animals, lack of pasture, conflicts with crop farmers and land conflict etc.
- The results revealed that 94 percent of the parishes in Uganda were challenged by animal theft, 93 percent animal pests and 91 percent were challenged with inadequate Pasture and 84 percent reported land conflict Table 19.8

Theft of animals 93.6

Pests of animals 93

Lack of pasture 90.9

Figure 19.12 Parishes reporting challenges of livestock Production (%)

Patterns by Background Characteristics

- Regarding animal pest challenges, West
 Nile reported the highest percentage of parishes challenged by animal pests (98%), followed by Karamoja (97%) and Teso & Bukedi (each with 96%).
- The theft of animals was the most predominant challenge in West Nile sub region affecting the 98 percent of their parishes, followed by Acholi with 96 percent, and Karamoja with 97 percent.
- The land conflict challenge of was also dominant in West Nile sub region affecting the 96 percent of their parishes, followed by Karamoja with 94 percent.
- Lack of pasture was notable in Bukedi parishes at 97 percent, followed by Busoga and west Nile (95%). **Table 19.8**

19.10 Challenges in Marketing of Agricultural Produce

The Government of Uganda is implementing the Parish Development Model through seven pillars; one of which is Agricultural Value-Chain Development (Production, Storage, Processing and Marketing). One of the characteristics of the Model Parish which the Government of Uganda strives to achieve is measurable increased production and marketing of agricultural products. The National Development Plan III also underpins agricultural post-harvest handling and marketing as one of the key projects to spur productivity and economic growth.

During the NPHC 2024, data was collected on the challenges which communities face in marketing agricultural products. Results show that overall, 97 percent of the parishes in Uganda reported bad roads a major challenge to marketing agricultural products, followed by lack of ready market at 96 percent, lack of means of transportation at 94 percent and bad weather at 93 percent. **Table 19.9**

Figure 19.13 Distribution of Parishes by challenges to marketing of agricultural produce (%)

FOOD SECURITY

Key Findings

- Four in every 10 (46%) of households were moderate or severely food insecure.
- Six in every ten households (63%) from Karamoja sub-region were severely food insecure followed by those from Teso (50%) and Bukedi (50%).
- Eighty eight percent of households from Nabilatuk district in Karamoja Subregion were moderate or severely food insecure
- The Sub-regions of Ankole and Buganda had the highest proportion of food secure households at (70% and 68% respectively).

ustainable Development Goal 2 aims to end hunger, achieve food security, improve nutrition, and promote sustainable agriculture by 2030. The continental, regional and national development frameworks such as Agenda 2063, EAC Vision, NDP's, and Vision 2040 promote interventions targeted to address food insecurity. In Uganda, where agriculture remains the backbone of the economy, the challenges surrounding food security are multifaceted. These challenges exacerbate food insecurity, leading to fluctuating food availability and increased vulnerability among households.

The use of the Food Insecurity Experience Scale (FIES) scale in monitoring progress toward these goals provides valuable insights into the effectiveness of interventions aimed at reducing food insecurity. The FIES is an experience-based metric of food insecurity severity that relies on people's direct responses to eight questions about their access to food. A probability distribution is applied to the household's responses to the 8 questions of the FIES Module, and the households are classified into three categories based on two globally established thresholds, 1) food secure or mildly insecure, 2) moderately or severely food insecure, and 3) severely food insecure.

Using the eight FIES questions, the NPHC2024 evaluated respondents' personal experiences with food insecurity in the household over the 12 months preceding the Census Enumeration Exercise. The respondent was answering on behalf of all household members. Overall, 92 percent of the households answered the FIES questions with a yes or no, 6% with a "don't know," and 2% chose not to respond. This data was analyzed to construct **SDG indicator 2.1.2**, which evaluates the prevalence of moderate or severe food insecurity in the population, based on the FIES methodology.

FIES Concepts and definitions

Food secure: A household is food secure if it consistently has adequate access to sufficient, safe, and nutritious food. These are households that do not experience difficulties in accessing adequate food. This means household members do not experience hunger, reduce meal sizes, or worry about running out of food.

Moderately Food Insecure: Households who have struggled to fulfill their basic food demands by compromising dietary quality and quantity but have not faced extreme food deprivation. This occurs when people have insufficient access to food for a more extended period, leading to a significant decline in their food intake and dietary quality. This includes households that may have to reduce the size or the variety of their diets, rely on less preferred or less nutritious foods, or limit portions, but they still generally have access to some food.

Severe Food Insecurity: Involves households experiencing hunger, sometimes for extended periods, and typically signifies a serious emergency where people may go days without adequate food or may run out of food and go for a day(s) without eating.

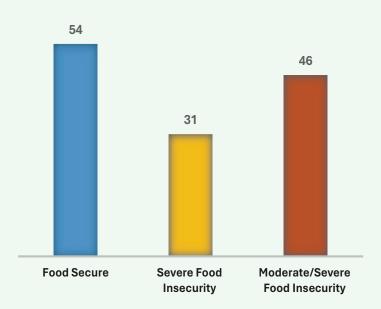

20.1 Households' Food Insecurity Experience

The **Food Insecurity Experience Scale (FIES)** is a globally recognized approach developed by the FAO (Food and Agriculture Organization) to measure food insecurity based on people's direct experiences. It captures a range of experiences related to food access difficulties, from mild to severe insecurity, and reflects the intensity of food insecurity at household levels using the eight FIES questions.

The FIES approach collects data on house's direct experiences with food access problems through questions like whether they worried about food, had to eat less, or went a day without food, allowing for a precise classification of food insecurity level due to lack of enough money and other resources.

Findings in Figure 20.1 show that overall, 54 percent of the households were food secure, implying they had adequate access to sufficient, safe, and nutritious food, three in every ten households (31%) were experiencing severe food insecurity, while 46 percent of households were moderately or severely food insecure, indicating they were "comprising on the quantity and quality of household meals."

Figure 20.1: Household Food Insecurity Experience (%)

20.2 Prevalence of Severe Food Insecurity at Sub-region Level

Severely food insecure households are those that have experienced the most severe forms of food insecurity, as measured by the FIES. This typically includes households that encountered the most extreme forms of food insecurity as explained in the concepts.

Figure 20.2 depicts households who experienced severe food insecurity, defined as "frequent and prolonged periods of insufficient food intake due to a lack of money and other resources." The sub-regions of Karamoja, Bukedi, and Elgon had the greatest percentage of extremely food insecure families (68% and 50%, respectively).

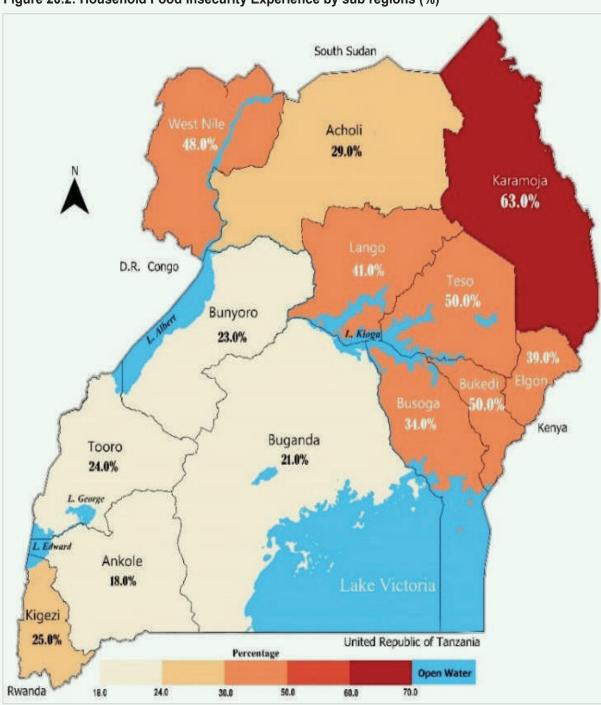

Figure 20.2: Household Food Insecurity Experience by sub regions (%)

20.3 Prevalence of Moderate or Severe Food Insecurity

Households are defined as moderate or severely food insecure if they seasonally reduce the quality or variety of their food intake. The sub-regions of Karamoja (81%), Teso (72%), Bukedi (69%), and West-Nile (68%) had the highest prevalence of households experiencing moderate or severe food insecurity, with Ankole reporting the lowest (30%)

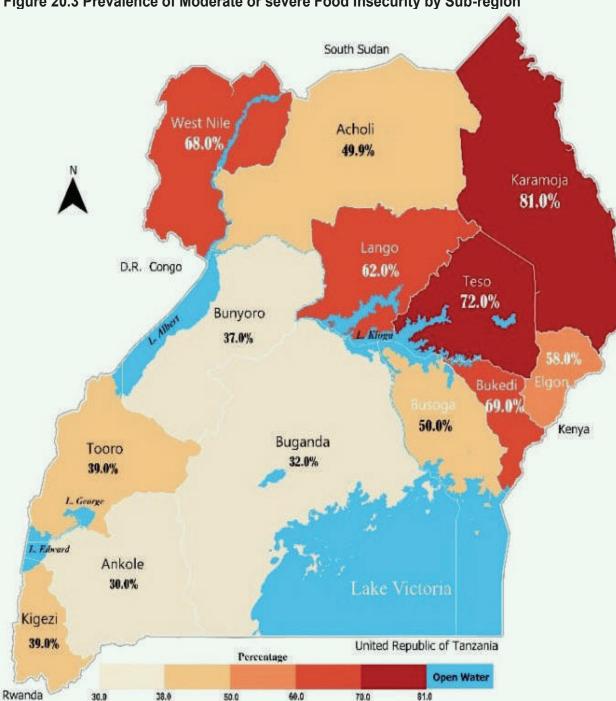

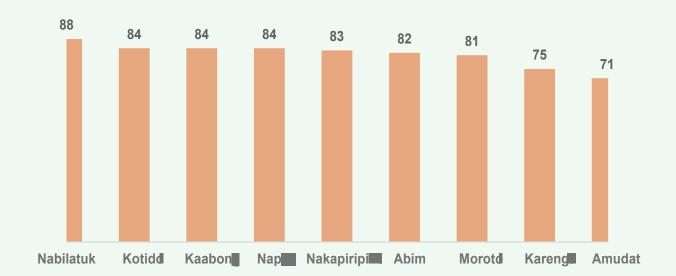

Figure 20.3 Prevalence of Moderate or severe Food Insecurity by Sub-region

Disaggregation by Districts of Karamoja in Figure 20.4 show that at least seven in every ten households in the sub-region were either moderately or severely food insecure. The district of Nabilatuk had the largest percentage of households (88%) experiencing moderate or severe food insecurity eating less of nutritious food and skip meals regularly.

Figure 20.4 Status of Moderate or Severe Food Insecurity within Districts of Karamoja Sub-region

20.4 Severe Food Insecurity within the 11 cities

Further analysis on Food Insecurity by cities was

done and results shown in Figure 20.5 indicate that the of households percentage experiencing severe food insecurity was highest in the cities of Soroti (43%), followed by Arua (40%) while Hoima (15%) indicated the lowest prevalence.

Figure 20.5 Severe Food Insecurity within the 11 cities

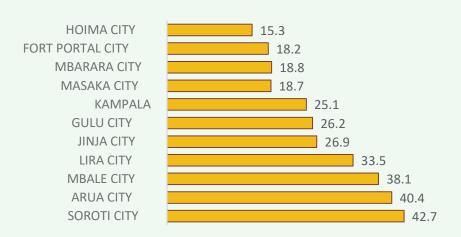

Figure 20.6 depicts that severe food insecurity decreases with increased in the education

level of households heads. Household heads who had not attained any formal education during the census enumeration had the highest prevalence of severely food insecure households (37%) as compared to household who had attained postsecondary education (18%)

Figure 20.6 Severe Food insecurity Status by education level of household

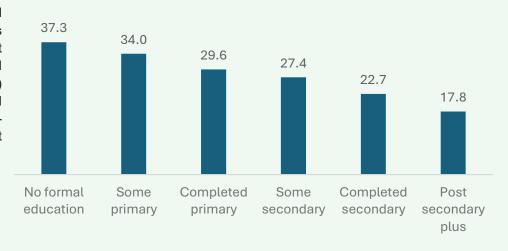

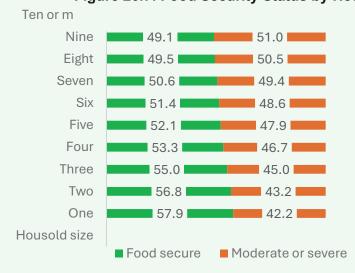

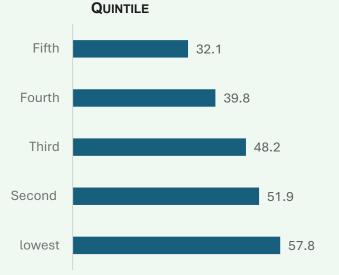

Figure 20.7 indicates that household size has an impact of the food security of households with (58%) of single member household members were food secure while (48%) of household with ten members or more declared to be food secure.

Figure 20.7: Food Security Status by Household Size

NPHC 2024

Figure 20.8 reveals an inverse relationship of household wealth quintile with moderate or severely food insecure households. Households in the fifth or highest wealth quintile had the lowest prevalence of moderate or severe food insecurity (32%) while those in the lowest wealth quintile had the highest prevalence of moderate or severe food insecurity at (58%)

For more information on the Food security, see the following tables below

Key Findings

Violence and Harmful Practices in the Communities

- Common crimes in communities: Overall, theft/ burglary/robbery was the highest form of crime reported in communities; accounting for 88 percent of the parishes, while murder was the least reported (26%).
- Domestic Violence and Rape: Domestic violence was commonly experienced in 91% of the parishes in Uganda; while rape was in 36% of the parishes.
- Sacrifices and Disappearance of residents: Only 4% and 3% of the parishes reported that child and adult sacrifice were common in their communities respectively. Disappearance of residents from their communities was commonly experienced in 17% of the parishes.
- Harmful practices and child-related practices: About 72% of the parishes in Uganda commonly experienced child battering/neglect, while 63 percent experienced child marriages and three (3) percent, FGM.

community-level indicators are measures that refer to population groups rather than individuals. They indicate what is happening at a community level, rather than the individual level; and offer objective measures of outcomes of interest. (Cheadle et al., 2000).

Community-level indicators enable the assessment of communities and provide a statistical basis for analyzing their nature, characteristics, and challenges, contributing to policy formulation and evaluation.

The NPHC 2024 defined the community as a group of persons living in a specified area or location and can be identified with common characteristics. In this case, the Local Council one (LC 1) was the community. The community questionnaire was administered in all LC1 villages across the country and gathered information on the services available and practices common to the communities. Data was obtained through Focus Group Discussions (FGDs) with residents in the community and Key Informant Interviews (KIIs) with the respective institution bearers in that village, like heath facility administrators and school head teachers.

For purposes of reporting, thematic areas were introduced based on services available to the communities and general living characteristics. This chapter presents information on the violence and harmful practices which were commonly experienced in the communities. The NPHC Community-level data was collected at the village level and has been analyzed at Parish level.

21.1 Administrative Units

At the time of the NPHC 2024, the country had 135 districts and 11 cities: an increase from 112 in 2014. Over time, the Government of Uganda has been expanding the number of administrative units over time; with the aim of easing administration and extending services closer to the people. The distribution of administrative units since 1969 is given in Tables 21.1 and 21.2.

21.2 Crimes and Violence in the Communities

Data was collected on violence, crimes and harmful practices which were commonly experienced in communities during the 12 months preceding the census undertaking. Community leaders, elders and other representatives participated in the FGDs through which they agreed on the common forms of violence, crimes and harmful practices which their communities experienced.

Parishes which experienced crimes, 12 months preceding the census

Percentage of parishes which commonly experienced selected crimes

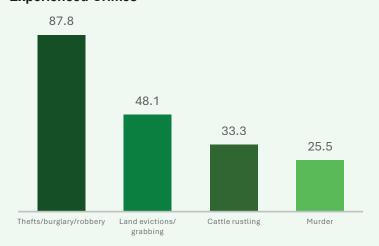

Population – Total number of parishes

Background Characteristics: Sub-region, Residence

21.2.1 Crime in the Communities

During data collection, the forms of crime which were discussed about included: thefts/burglary, robbery, murder, land evictions/grabbing and cattle rustling. The results presented in this section show the percentage of parishes which experienced the selected crimes in the 12 months preceding the census. Overall, theft/burglary/robbery was the highest form of crime reported in parishes; accounting for 88 percent of the parishes, while murder was the least reported (26%).

Fig 21.1: Percentage of Parishes by Commonly Experienced Crimes

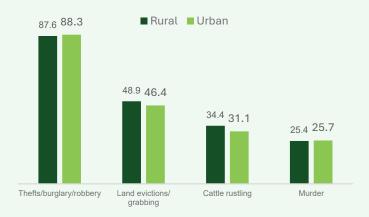

Patterns by Background Characteristics

As shown in Figure 21.2, the crimes were nearly equally prevalent in the rural and urban areas; though theft was slightly higher in the urban area (by 0.7%) and land evictions/grabbing, higher in the rural areas by 2.5 percent.

As shown in Table 21.3, theft/Burglary/robbery was most predominant in Lango sub-region; with 92 percent of the parishes; followed by Bunyoro (91%) and it was least experienced in Elgon sub-region (83%).

Fig 21.2: Percentage of Parishes, by Common Crimes and Residence

Land evictions/grabbing was more predominant in Karamoja sub-region (72%) and was least experienced in Ankole (32%). Cattle rustling was reported to have been most experienced by the communities in Karamoja sub-region (90%), followed by parishes in Buganda (40%) and it was least experienced in Tooro and West Nile (21% each).

21.2.2 Domestic Violence and Rape in the Communities

Government of Uganda regards domestic violence as a great concern to the community from the human rights, economic and health perspectives. The Government has put in place legislature and other measures to address domestic violence. Up-to-date and reliable data is required to address national, regional and international commitments to address Gender Based Violence in general and domestic violence in particular.

Domestic Violence (DV) according to the Domestic Violence Act, 2010 constitutes any act or omission of a perpetrator which—(a)harms, injures or endangers the health, safety, life, limb or well-being, whether mental or physical, of the victim or tends to do so and includes causing physical abuse, sexual abuse, emotional, verbal and psychological abuse and economic abuse;(b)harasses, harms, injures or endangers the victim with a view to coercing him or her or any other person related to him or her to meet any unlawful demand for any property or valuable security;(c)has the effect of threatening the victim or any person related to the victim by any conduct mentioned in paragraph (a) or (b); or(d)otherwise injures or causes harm, whether physical or mental, to the victim;

Rape is a form of sexual violence where sexual intercourse, or other forms of sexual penetration are performed on the victim without their consent. It can be part of domestic violence or otherwise.

Parishes which experienced domestic violence and rape, 12 months preceding the census. Percentage of parishes which commonly experienced domestic violence and rape.

Overall, domestic violence was commonly experienced in 91 percent of the parishes in Uganda compared to rape which was experienced by slightly more than a third (36%) of the parishes. See table 21.4 for details.

Patterns by Background Characteristics

Results presented in Figure 21.3 show the percentage of parishes which experienced domestic violence during the 12 months preceding the census. A slightly higher percentage of parishes in the rural areas (92%) experienced domestic violence as compared to parishes in the urban areas (90%). The percentage of parishes which commonly experienced domestic violence was highest in Lango and Acholi Sub-regions (96%), while Elgon had the lowest (86%).

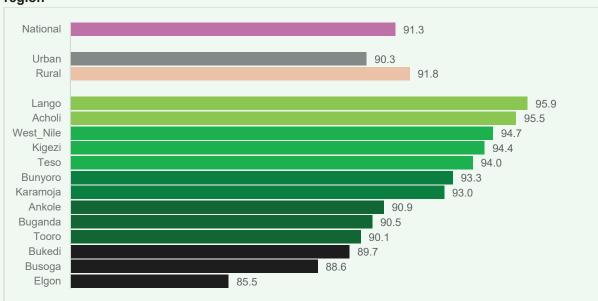

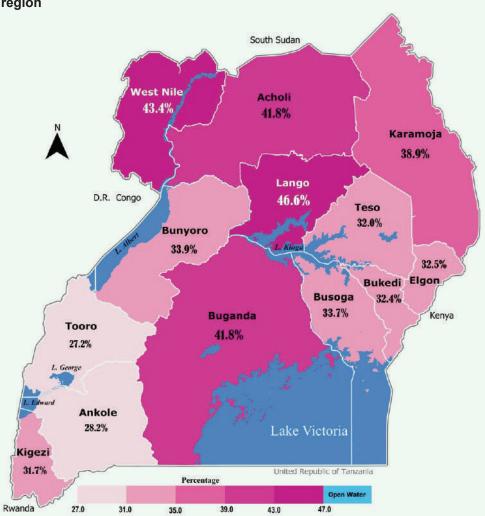

Fig 21.3: Percentage of Parishes which experienced Domestic Violence by Residence and Subregion

Results presented in Figure 21.4 show the percentage of parishes which commonly experienced rape during the 12 months preceding the census. This was highest in Lango Sub-region (47%), while Tooro had the lowest (27%).

21.2.3 Child and Adult Sacrifices, and Disappearance of Residents

Parishes which experienced sacrifices and disappearance of residents, 12 months preceding the census

Percentage of parishes which commonly experienced child and adult sacrifice, and disappearance of residents

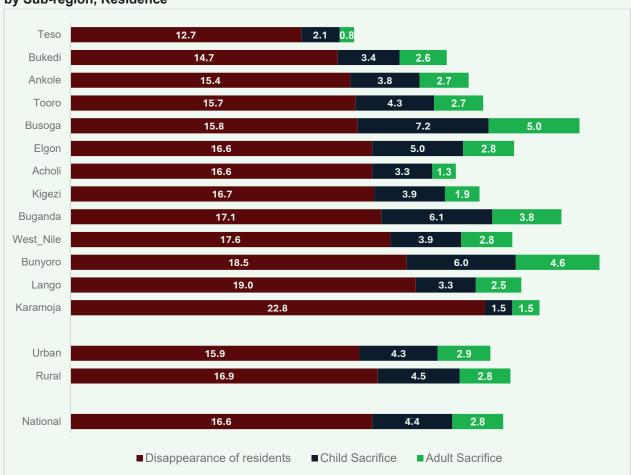

Population – Total number of parishes

Overall, only four and three percent of the parishes reported that child and adult sacrifice were common in their communities respectively, while 17 percent of the parishes reported disappearance of residents from their communities (Table 21.5).

Patterns by Background Characteristics

Disappearance of LC1 residents from the communities was reported slightly higher in the rural areas (17%) as compared to those in the urban (16%). At the sub-regional level, there was a comparatively high percentage of parishes in Karamoja that experienced the disappearance of residents during the 12 months preceding the census (25%), while Teso had the lowest (13%). The biggest percentage of child and adult sacrifice was reported by parishes in Busoga (7% and 5% respectively).

Fig 21.5: Percentage of Parishes that experienced Sacrifices and Disappearance of Residents, by Sub-region, Residence

21.2.4 Harmful practices and Child-related Violence

Harmful practices, including child marriages and Female Genital Mutilation (FGM), are human rights violations, bearing negative consequences on the victims. FGM and child marriages rob girls of their childhood, deny them the chance to determine their own future, and threaten the well-being of societies. In some societies in Uganda, FGM could be preparing the girls for marriage and therefore goes along side with child marriage.

Parishes which experienced harmful practices, 12 months preceding the census

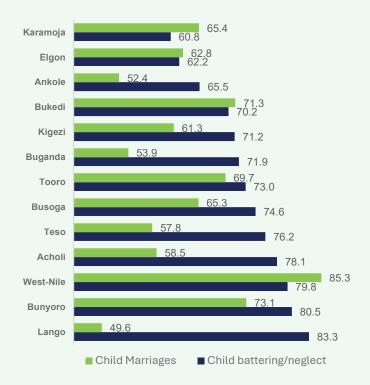

Percentage of parishes which commonly experienced harmful practices and child-related violence **Population** – Total number of parishes

Background Characteristics: Sub-region, Residence

Results in Figure 21.6 show that child battering was more commonly experienced in the parishes in the sub-regions of Lango (83%) and Bunyoro (81%). This child-related violence was least experienced in Karamoja (61%) and Elgon (62%) subregions.

On the other hand, child marriages were most reported in the parishes of West Nile (85%) and least reported in Lango sub-region (50%).

Fig 21.6: Percentages of Parishes which Experienced Child Marriages

POLICY RECOMMENDATIONS

his section highlights some policy implications from the key findings of the NPHC 2024. It's important to note that, while some implications are identified, they will require extensive investigation through research and policy evaluation to make meaningful conclusions. Some of the implications are highlighted below.

1. Population Size and composition

Uganda's population is larger and growing at a faster rate. This has several implications:

- i) For the country to attain its medium and long-term per capita income targets, the economy must grow at a faster rate than the growth rate in population. Strategies to grow the economy faster are required more now than never.
- ii) There is need to increase total spending on social services to maintain or improve per capita spending. To sustain the current per capita spending on grants for education and health, there will be need to increase total spending significantly in these areas.
- iii) There will be increased pressure on social services and public goods. This calls for increased focus on investment in maintenance and expanding capacity of several facilities. Relatedly, there will be need to evaluate the continued effectiveness of some public investment options. For example, low-cost seals for urban access roads with daily traffic capacity limitations.
- iv) Population distribution should inform the design of key Government programmes for effective targeting & impact. This has profound implications for programmes like those oriented towards full monetization of the economy, and employment among others.
- v) The slight reduction in the population growth rate together with the reduction in fertility and household size calls for the need to evaluate the effectiveness of reproductive health interventions.
- vi) The sustained increase in population density implies the need for a stronger focus on land use and area-based planning.
- vii) The age distribution of the population, with a largely young and youthful population implies the need for sustained focus on harnessing the demographic dividend. Interventions to increase health, education, skills and employability of the population for increased productivity are central going forward.
- viii) The doubling of the urban population between 2014 and 2024 implies the need for increased attention to urban planning.
- ix) The high variation in the daytime population especially around the Greater Kampala Metropolitan areas indicates the need for understanding the role and significance of metropolitan planning and implementation.
- x) With Uganda's population exhibiting a high level of religiosity with only 0.2 percent stating that they had no religion, the role of religious institutions in supporting the implementation of public interventions like community mobilization, mindset change, parish development model, public health, etc. remains critical.

2. EDUCATION

- i) The low access to Early Childhood Education (ECE) compared to primary education (40%) has implications on the need to consider public financing. This is critical since ECE is the most important stage of development in a child's education cycle as it increases their opportunity to perform better in school and in life.
- ii) Most Ugandans having either only some primary education or no formal education, has implications on the need for informal and modular skills-based training programs for a productive and skilled population.
- iii) There is significant progress on increasing availability of primary and secondary schools in all parishes and sub counties respectively, though with minimal education outcomes. This has implications on the need to focus more on the quality of education.
- iv) With only 22% and 7% accessing secondary education and post-secondary education respectively, the role of public financing is still critical at these levels. Programmes like Universal Secondary Education and Student scholarships and Loan schemes are still critical for increased access

3. HEALTH

- i) **Enhance Routine Childhood Vaccination Programs**: Given the high vaccination coverage of 99% among children aged 0-5 years, it's crucial to maintain and improve these immunization programs. Policies should focus on sustaining public awareness campaigns, particularly in regions with lower coverage, to ensure all children receive vaccinations on schedule.
- ii) **Increase Access to Mosquito Nets**: With 87% of households owning at least one mosquito net, initiatives should aim to bridge the gap in regions like Karamoja, where ownership is significantly lower (73%). Implementing targeted distribution campaigns, especially during malaria peak seasons, can enhance prevention efforts in high-risk areas.
- iii) **Expand Health Insurance Coverage**: With only 1% of the population having health insurance, there is a need to develop policies that promote affordable health insurance schemes. Incentives for both private and public health insurance providers can help increase coverage and reduce out-of-pocket expenses for families.
- iv) **Strengthen Community Health Facilities**: The findings indicate significant disparities in health center availability across regions. Policies should prioritize the establishment and funding of Health Centre IIs and IIIs, especially in underserved rural areas, to enhance access to primary health care services and improve health outcomes.
- v) **Improve Health Outbreak Response Mechanisms**: Given the community's varied understanding of health outbreaks, it's essential to implement educational programs that clarify what constitutes an outbreak and how to respond. Strengthening surveillance systems and ensuring rapid response capabilities can help mitigate the impact of future health crises.

4. Information and Communications Technology (ICT)

- The increased usage of ICT services has implications on the efficiency of public and private institutions.
- ii) Promote digital literacy across all population groups to match the digital revolution

5. FERTILITY

- i) Implement Comprehensive Family Planning Programs: To address the Total Fertility Rate (TFR) of 4.5 children per woman, especially among adolescents, it is essential to enhance family planning initiatives. This should include education on reproductive health, increased access to contraceptive methods, and outreach programs targeting adolescents and rural populations, particularly in regions with high fertility rates like Teso and Bunyoro.
- ii) **Promote Female Education and Empowerment**: The data indicates that fertility levels vary significantly with women's educational background. Policies should focus on improving girls' access to education and promoting gender equality, as higher educational attainment is associated with lower fertility rates. Investment in programs that keep girls in school and empower them through vocational training can lead to better reproductive choices and health outcomes.
- iii) **Enhance Maternal Health Services**: There is an urgent need to improve maternal health services which includes ensuring access to quality prenatal and postnatal care, especially for young mothers and those with high-risk pregnancies. Training healthcare providers to recognize and manage high-risk conditions effectively will reduce complications associated with childbirth and improve overall maternal and child health.
- iv) The very low (1%) coverage of health insurance has implications on the need to strengthen national health insurance and community-based insurance. Leveraging both private and public financing will be critical to increase coverage.
- v) Although the increased presence of health centers at all levels has led to increased access to health care, there is need for increased focus on the quality and functionality for much better health outcomes.
- vi) Improvement in life expectancy implies increased effectiveness of health and welfare interventions. These need to be sustained going forwards.

6. MORTALITY

- i) Strengthen Maternal and Child Health Services: To reduce maternal mortality, which currently stands at a Maternal Mortality Ratio (MMR) of 207 per 100,000 live births, it is crucial to enhance maternal healthcare services. This includes increasing access to skilled birth attendants, ensuring availability of emergency obstetric care, and implementing comprehensive antenatal and postnatal care programs. Targeted interventions should focus on high-risk regions such as Karamoja, where maternal mortality rates are significantly higher.
- ii) Enhance Data Collection and Reporting on Mortality: Given the issues of under-reporting deaths in census data, it is essential to improve the reliability of mortality statistics through better data collection and reporting systems. This includes training community health workers to accurately report deaths, implementing community-based surveillance systems, and promoting public awareness on the importance of reporting all deaths. Accurate data will help in formulating effective health policies and interventions.

iii) Implement Targeted Health Education Campaigns: To address the disparities in childhood mortality rates, especially the higher rates in rural areas, health education campaigns should be implemented. These campaigns should focus on promoting awareness of child health practices, such as proper nutrition, vaccination, and hygiene, and encourage community engagement. Special attention should be given to educating parents in high-mortality regions, particularly in Karamoja and Kigezi, to improve overall child health outcomes and reduce mortality rates.

7. LABOUR FORCE

- i) The government should invest in expanding access to quality education and vocational training programs, particularly targeting rural areas and individuals with low educational attainment. This includes developing partnerships with educational institutions and the private sector to create relevant training programs that align with the needs of the job market.
- ii) Implement policies aimed at promoting gender equality in the workforce, such as targeted employment programs for women, mentorship initiatives, and support for women entrepreneurs. Additionally, ensure that workplaces adopt family-friendly policies that support work-life balance, making it easier for women to enter and remain in the labor force.
- iii) The government should develop targeted employment programs for youth, including internships, apprenticeships, and entrepreneurship support. Collaborating with private sector stakeholders to create job placement opportunities can help bridge the gap between education and employment for young people.
- iv) Design and implement targeted regional development programs that focus on job creation and economic empowerment in areas with high unemployment rates. This could involve investing in local industries, infrastructure development, and supporting small and medium enterprises (SMEs) to stimulate economic activity and create job opportunities tailored to the specific needs of the region.
- v) The rising unemployment especially for the youth implies the need for increased investment in targeted interventions for increased employability and employment creation.

8. HOUSING AND HOUEHOLD CHARACTERISTICS

- i) **Promote Affordable Housing Initiatives**: Given the high percentage of owner-occupied dwelling units (66%) and the significant variation in ownership across regions, the government should implement policies that promote affordable housing initiatives. This can include providing subsidies, low-interest loans, or tax incentives to encourage home ownership, especially in regions like Buganda where renting is more prevalent. Collaborating with private developers to construct affordable housing units can also help meet demand.
- ii) Improve Sanitation Facilities and Access to Clean Water: With 19% of households relying on unimproved water sources and 50% with un-improved sanitation facilities, policies should focus on improving access to clean drinking water and adequate sanitation. This can be achieved through investments in water infrastructure, such as boreholes and piped water systems, as well as expanding sanitation programs that encourage the construction of safe toilet facilities, especially in regions like Karamoja with high rates of open defecation.
- iii) Enhance Energy Access and Promote Clean Energy Sources: The reliance on wood fuel for cooking (62%) poses health and environmental risks. Policies should prioritize expanding access to clean and renewable energy sources, such as solar and biogas. This can include government incentives for households to switch to cleaner cooking technologies and subsidizing the costs of solar home systems. Educational campaigns can also raise awareness about the health benefits of using clean energy.

- iv) Address Overcrowding in Housing: The data indicating that 53% of households use only one room for sleeping and a significant proportion of households experience overcrowding should prompt targeted interventions. The government should develop housing policies that encourage the construction of adequate living spaces to reduce overcrowding. This can involve zoning regulations that promote the development of larger homes and multi-unit housing options.
- v) Strengthen Waste Management and Environmental Health Policies: With 92% of households using improper waste disposal methods, it is crucial to implement policies that enhance solid waste management. This can include establishing waste collection systems, promoting community-based waste management initiatives, and educating the public about proper disposal practices. Furthermore, the government should integrate waste management into urban planning to mitigate environmental hazards and improve public health.
- vi) The high proportion (89%) of households using biomass (firewood and charcoal) as fuel for cooking has serious environmental implications and calls for hastened implementation of interventions for the energy transition.
- vii) With only about half of the population (58 percent) that own land having documents of ownership, there is need for a specific intervention to increase registration and documentation. This is critical since land serves as a critical factor of production and its registration enables easy transfer of ownership and can be used to access other factors of production like capital.

9. SUBSISTENCE ECONOMY AND HOUSEHOLD WELFARE

- i) The significantly higher proportion of households (33%) still in the subsistence economy implies that the country should continue to prioritize interventions for commercialization of agriculture and full monetization of the economy. Affirmative action may be required for Karamoja that accounted for the highest proportion (71%) of households in the subsistence economy.
- ii) **Strengthen Support for Agricultural Productivity**: Develop agricultural extension services that provide subsistence farmers with access to improved farming techniques, quality seeds, and tools. This includes investing in irrigation and infrastructure to enhance productivity, ensuring food security, and increasing market access for surplus produce.
- iii) **Facilitate Access to Financial Services**: Promote financial inclusion by establishing microfinance institutions and cooperative savings groups in rural areas. This would provide subsistence households with credit, savings opportunities, and financial literacy training, allowing them to invest in incomegenerating activities and build assets.
- iv) **Implement Social Protection Programs**: Design and implement comprehensive social safety nets and cash transfer programs aimed at households living below the poverty line. These programs should specifically target the most vulnerable groups, providing them with immediate relief and supporting long-term economic resilience.
- v) **Promote Gender Equality in Asset Ownership**: Develop policies that promote equal access to land and property rights for women and marginalized groups. This includes legal reforms to strengthen land tenure security and awareness campaigns to educate communities about the importance of equitable asset ownership for improving household welfare.

10: CHILDREN

i) **Strengthen Birth Registration Processes:** Enhance the implementation of the Registration of Persons Act, 2015, by increasing awareness campaigns in rural and underserved communities about

- the importance of birth registration within the stipulated 90 days. Ensure that resources and personnel are adequately available to facilitate timely registration.
- ii) Expand Access to Quality Education: Implement targeted programs aimed at reducing the number of out-of-school children, particularly in sub-regions with the highest rates, such as Karamoja and West-Nile. This can be achieved by providing incentives for school attendance, increasing the number of schools, and improving school infrastructure, particularly in rural areas.
- iii) Implement Comprehensive Support Systems for Orphans and Vulnerable Children: Develop and expand social protection programs specifically targeting orphaned children and those at risk. This should include access to educational scholarships, healthcare, and psychosocial support services tailored to their unique needs.
- iv) Promote Awareness and Prevention of Early Childbearing and Marriage: Launch community-based awareness programs addressing the risks of early childbearing and marriage, emphasizing the importance of education and reproductive health. Partner with local organizations to engage communities in discussions about gender equality and children's rights.
- v) Improve Living Conditions for Children: Develop and fund initiatives aimed at improving the living conditions of children, particularly in underprivileged sub-regions. This could include investing in infrastructure for clean energy, improved water sources, and sanitation facilities. Policies should prioritize vulnerable populations and target areas with high rates of open defecation and inadequate housing conditions.

11: OLDER PERSONS

- i) Enhance Data Collection and Research on Older Persons: Establish a comprehensive and continuous data collection system focused on older persons to inform evidence-based policy development and planning. This system should include demographic characteristics, health status, education levels, and living conditions to ensure that policies address the specific needs of this population.
- ii) Increase Access to Education and Literacy Programs: Develop targeted educational and literacy programs for older persons, particularly for those with low levels of formal education. These programs should focus on basic literacy and life skills, enhancing their ability to engage in economic, social, and cultural activities. Partnerships with local organizations and community centers can facilitate the implementation of these programs.
- iii) Strengthen Social Support Systems and Livelihood Opportunities: Create initiatives to provide financial and social support to older persons, including expanding access to government programs such as the Social Assistance Grant for the Elderly (SAGE). Additionally, promote alternative livelihood programs that reduce dependency on subsistence agriculture, enabling older persons to contribute economically through age-appropriate work opportunities.
- iv) **Promote Awareness and Involvement in Community Affairs**: Implement community awareness campaigns to recognize and celebrate the contributions of older persons in society. Encourage their active participation in local governance, community decision-making processes, and leadership roles, ensuring their voices are heard and respected. This involvement can enhance their social integration and reduce feelings of isolation and marginalization.

12. FOOD SECURITY

i) Comprehensive Data Collection System for Older Persons: Establish a centralized, continuous data collection system dedicated to older persons that includes demographic details, health status, educational attainment, and living conditions.

- ii) **Targeted Education and Literacy Initiatives:** Develop and implement targeted educational programs specifically designed for older persons, emphasizing basic literacy, numeracy, and life skills.
- iii) **Expansion of Social Support and Livelihood Programs:** Increase funding and accessibility to social support programs for older persons, including expanding the Social Assistance Grant for the Elderly (SAGE) and introducing alternative livelihood initiatives.
- iv) **Community Awareness and Advocacy Campaigns:** Launch community awareness campaigns aimed at recognizing and valuing the contributions of older persons in society.

13. REFUGEE CHARACTERISTICS

- i) **Enhance Registration and Data Collection:** Strengthen the registration process for refugees to ensure accurate data collection on demographics, living conditions, and access to services.
- ii) **Improve Access to Education and Literacy Programs**: Develop and expand education and literacy programs tailored for refugees, focusing on children and older persons with limited formal education.
- iii) Facilitate Economic Inclusion and Employment Opportunities: Implement policies that promote economic inclusion for refugees, including access to work permits and training programs that enhance skills and employability.
- iv) **Promote Digital Inclusion and ICT Access**: Enhance access to information and communication technology (ICT) for refugees, focusing on mobile phone and internet accessibility.
- v) **Develop Inclusive Health and Support Services:** Establish comprehensive health and support services that address the specific needs of refugees, including those with disabilities, mental health support, and maternal care.
- vi) The significantly higher population of refugees implies the need for increased focus on sustainable planning for refugees and evaluating the possible options for integration with host communities.

14. ENVIRONMENT AND CLIMATE CHANGE

- The increased occurrence of climate change and related incidents implies the need for increased focus on integrating climate change in planning, budgeting and implementation of adaptation and coping measures.
- ii) The results on waste management indicating an increasing proportion of E-waste without proper disposal measures as majority disposed through burning. There is need to consider implementation of a comprehensive waste management strategy.
